PREFACE	vii
CHAPTER 1 — GENERAL FEATURES OF THE FATIGUE PROCESS	I
(M. Klesnil, P. Lukas, J. Polak)	
1.1 Cyclic hardening/softening process	2
1.1.1 Basic characteristics of cyclic plastic deformation	2
1.1.2 Dynamics of cyclic plastic deformation	6
1.1.3 Cyclic plastic properties	9
1.1.3.1 FCC metals	10
1.1.3.2 Bcc metals	26
1.1.3.3 Cyclic plasticity of steels	32
1.2. Nucleation of cracks	40
1.2.1 Sites of nucleation	40
1.2.2 Single-phase metals and alloys	43
1.2.3 Precipitation-hardened materials	48
1.2.4 Materials after surface treatment	50
1.2.5 End of nucleation stage. Interpretation of fatigue limit	53
1.2.6 Some consequences of the model of critical short cracks l_c	56
1.3 Fatigue crack propagation	59
1.3.1 Mechanisms of fatigue crack growth	59
1.3.2 Application of fracture mechanics to fatigue cracks	63
1.3.3 Effect of temperature and corrosive environment	67
1.3.3.1 Effect of lower temperatures	67
1.3.3.2 Effect of higher temperatures	69
1.3.3.3 Effect of corrosive environment	71
References	74
CHAPTER 2 — LOW-CYCLE FATIGUE	78
(M. Klesnil, P. Lukás, J. Polak)	
2.1 Cyclic plasticity	79
2.1.1 Description of the cyclic stress-strain response	80
2.1.2 Constant amplitude harmonic loading	82
2.1.2.1 Fatigue hardening/softening curves	84
2.1.2.2 Cyclic stress-strain curve	86
2.1.3 Mechanism of cyclic straining and cyclic stress	90

2.1.3.1 Structure of cyclically strained metals	90
2.1.3.2 Cyclic stress	91
2.1.3.3 The growth and fall in effective stress in a microvolume	95
2.1.4 Hysteresis loop	99
2.1.4.1 Statistical theory	99
2.1.4.2 Internal and effective stress along the hysteresis loop	103
2.1.4.3 Experimental study of the effective stress in cyclic straining	105
2.1.4.4 Consequences of statistical theory	108
2.1.5 Variable amplitudes	109
2.1.5.1 Sudden strain amplitude changes	109
2.1.5.2 Variation of strain amplitudes	111
2.1.6 Stress and strain concentration in a notch	116
2.1.7 Effect of service factors	120
2.1.7.1 Low temperatures	120
2.1.7.2 Elevated temperatures	122
2.2 Fatigue life	124
2.2.1 Mechanism of fatigue crack initiation and growth	126
2.2.2 Fatigue life of smooth bodies	128
2.2.3 Fatigue life of notched bodies	132
2.2.3.1 Local stress and strain approach	132
2.2.3.2 Simulation of the notched body	134
2.2.4 Fracture mechanics approach	136
2.2.5 Variable amplitudes	141
2.2.6 Effect of service factors on fatigue life	145
2.2.6.1 Low temperatures	145
2.2.6.2 Elevated temperatures	146
References	149
CHAPTER 3 — HIGH-CYCLE FATIGUE	155
(V. T. Troshchenko, L. A. Khamaza, V. V. Pokrovskii)	
3.1 Basic information about inelasticity of metals	155
3.2 Mechanism of inelastic deformation of metals	162
3.3 Some laws of inelastic deformation and fatigue damage	177
3.3.1 Influence of a number of load cycles	178
3.3.2 Influence of stress levels	182
3.3.3 Influence of temperature	183
3.3.4 Influence of stress gradient	184
3.3.5 Influence of load regime variability	192
3.4 Strain and energy criteria of fatigue damage of metals	200
3.4.1 Strain criteria	200
3.4.2 Energy criteria	207
3.5 Accelerated method of fatigue limit determination	216
3.5.1 Accelerated fatigue limit determination of metals based on cyclic stress-strain curves	217
3.5.2 Accelerated fatigue limit determination of metals based on energy criteria	220
References	223

CHAPTER 4 — RESISTANCE TO FATIGUE CRACK PROPAGATION	228
(V. T. Troshchenko, L. A. Khamaza, V. V. Pokrovskii)	
4.1 Strength of cyclically loaded components with cracks	228
4.2 Resistance of components to cracks, effect of service factors	243
4.2.1 Effect of defects and environment	244
4.2.2 Method of stress intensity factor determination	247
4.2.3 Curves of fatigue crack propagation rate	250
4.2.4 Protection for increasing fatigue strength and resistance to crack initiation	253
4.2.5 Method for calculating fatigue life of compressor blades	254
4.2.6 Prediction of fatigue life of gas turbine blades containing cracks under conditions of overload	256
References	258
CHAPTER 5 — OPERATING FATIGUE LIFE	261
(M. Bily, J. Cacko, V. Kliman)	
5.1 Operating loads	264
5.1.1 Measurement of operating loads	265
5.1.2 Evaluation of operating loads	269
5.1.2.1 Occurrences of characteristic parameters	273
5.1.2.2 Statistical characteristics of the correlation theory of random processes	280
5.1.2.3 Parameters of time series	289
5.1.3 Laboratory reproduction of operating processes	290
5.2 Modelling of operating processes	293
5.2.1 Simulation of occurrences of characteristic parameters	294
5.2.1.1 Simulation of a random process by blocks of sinusoidal cycles or by individual cycles	295
5.2.1.2 Simulation of a random process by half-cycles	300
5.2.1.3 Simulation of transitions between ordinates	304
5.2.1.4 Simulation of local process extremes (envelopes)	306
5.2.2 Simulation of the statistical characteristics of random processes	309
5.2.2.1 Simulation of a probability density function of ordinates	312
5.2.2.2 Simulation of a Gaussian random process power spectral density	320
5.2.2.3 Simultaneous simulation of a probability density function of ordinates and power spectral density	324
5.2.3 Concluding remarks on modelling of operating random processes	324
5.3 Calculation of operating fatigue endurance using material cyclic stress-strain properties	328
5.3.1 Cyclic stress-strain curve	332
5.3.2 Influence of mean level and frequency on the cyclic stress-strain curve	335
5.3.3 Hysteresis energy of cyclic loading	339
5.3.3.1 Hysteresis energy of one loading cycle and hysteresis energy of one operating load unit	339

5.3.3.2 Hysteresis energy to fracture	347
5.3.4 Estimation of fatigue life under operating loads	350
5.3.4.1 Calculation of fatigue damage and the condition of fracture	352
5.3.4.2 Influence of loading characteristics on fatigue life	357
5.3.4.3 Comparison of the proposed fatigue life estimation with the Palmgren-Miner hypothesis	360
References	364
CONCLUSIONS	365
SUBJECT INDEX	367
