Course 1. Applied conformal field theory, by P. Ginsparg 1

1. Conformal theories in d dimensions	6
1.1. Conformal group in d dimensions	6
1.2. Conformal algebra in 2 dimensions	8
1.3. Constraints of conformal invariance in d dimensions	11
2. Conformal theories in 2 dimensions	14
2.1. Correlation functions of primary fields	14
2.2. Radial quantization and conserved charges	17
2.3. Free boson, the example	22
2.4. Conformal Ward identities	25
3. The central charge and the Virasoro algebra	27
3.1. The central charge	27
3.2. The free fermion	30
3.3. Mode expansions and the Virasoro algebra	31
3.4. In- and out-states	32
3.5. Highest weight states	36
3.6. Descendant fields	39
3.7. Duality and the bootstrap	42
4. Kac determinant and unitarity	45
4.1. The Hilbert space of states	45
4.2. Kac determinant	49

4.3. Sketch of non-unitarity proof	51
4.4. Critical statistical mechanical models	53
4.5. Conformal grids and null descendants	56
5. Identification of $m = 3$ with the critical Ising model	57
5.1. Critical exponents	58
5.2. Critical correlation functions of the Ising model	61
5.3. Fusion rules for $\alpha < 1$ models	64
5.4. More discrete series	66
6. Free bosons and fermions	69
6.1. Mode expansions	69
6.2. Twist fields	70
6.3. Fermionic zero modes	74
7. Free fermions on a torus	77
7.1. Back to the cylinder, on to the torus	77
7.2. $c = \frac{1}{2}$ representations of the Virasoro algebra	a2
7.3. The modular group and fermionic spin structures	84
7.4. $c = \frac{1}{2}$ Virasoro characters	88
7.5. Critical Ising model on the torus	91
7.6. Recreational mathematics and ϑ-function identities	97
8. Free bosons on a torus	104
8.1. Partition function	104
8.2. Fermionization	110
8.3. Orbifolds in general	112
8.4. S^1/\mathbb{Z}_2 orbifold	116
8.5. Orbifold comments	121
8.6. Marginal operators	123
8.7. The space of $\alpha = 1$ theories	125
9. Affine Kac-Moody algebras and coset constructions	130
9.1. Affine algebras	130
9.2. Enveloping Virasoro algebra	132
9.3. Highest weight representations	136
9.4. Some free field representations	141
9.5. Coset construction	145
9.6. Modular invariant combinations of characters	150
9.7. The A-D-E classification of $SU(2)$ invariants	153
9.8. Modular transformations and fusion rules	157
10. Advanced applications	158
References	159

Course 2. John L. Cardy, Conformal invariance and statistical mechanics 169

1. Introduction	173
1.1. Outline and aims	173
1.2. Statistical mechanics and quantum field theory	174
1.3. Scale invariance, conformal invariance and the stress tensor	177
1.4. The Gaussian model	182
2. Finite-size scaling of the free energy	184
2.1. Finite-size scaling at criticality	184
2.2. The trace anomaly	185
2.3. Systems with a boundary	188
2.4. Corners on the boundary	191
2.5. On hearing the shape of a drum	193
3. Theories defined on a cylinder	194
3.1. Transfer matrix on the cylinder	194
3.2. Lattice models on the cylinder	197
3.3. Other boundary conditions	202
4. Modular invariance on the torus	204
4.1. Theories defined on a torus	204
4.2. The Gaussian model	296
4.3. Decomposition into characters	297
4.4. Theories with $c < 1$	268
5. Identification of operators in particular models	212
5.1. The fusion rules	212
5.2. The Ising model	213
5.3. Lattice effects	218
5.4. Landau-Ginzburg classification	218
5.5. The J-state Potts model	220
6. The continuum limit away from criticality	221
6.1. The stress tensor	221
6.2. Zamolodchikov's c -theorem	223
6.3. The Ising model	226
6.4. Perturbative calculation of c	227
6.5. Application to models with $c < 1$	229
6.6. Conserved currents away from criticality	231
7. The spectrum of the corner transfer matrix in solvable models	234
7.1. Introduction	234
7.2. Commuting transfer matrices	235
7.3. Corner transfer matrix	237
7.4. The eigenvalues of $\hat{A}(u)$	249

7.5. Character formulae	241
References	243

Course 3. Conformal field theories, Coulomb gas picture and integrable models, by J.-B. Zuber 247

1. Introduction	250
2. $c = 1$ conformal theories and the 6-vertex model	250
3. $c < 1$ conformal theories	254
3.1. Classification of minimal theories	254
3.2. Feigin-Fuchs representation	259
3.3. Coulomb gas picture in Statistical Mechanics	260
3.4. Floating charges on a torus	262
3.5. Restricted Solid-on-Solid models	265
4. Generalized height models	266
4.1. Yang-Baxter equation and Temperley-Lieb algebra	266
4.2. Models attached to graphs	269
5. Higher spin models	273
5.1. Higher vertex models and their critical line	273
5.2. Higher $SU(2) \times SU(2)/SU(2)$ coset models	275
6. Conclusion	276
References	277

Seminar 1. Symmetries of the XXZ chain and quantum $SU(2)$, by V. Pasquier and H. Saleur 281

Seminar 2. Recent progress in rational conformal field theory, by R. Dijkgraaf 291

1. Introduction	294
2. Rational conformal field theories	294
3. RCFT in genus one	298
4. An example	301
5. Rational Gaussian models	302
References	303

Course 4. Two-dimensional quantum gravity. Superconductivity at high T_C , by A. Polyakov 305

- I. Introduction 308
 - 1.1. Aim of the lectures 308
 - 1.2. Elementary excitations 308
 - 1.3. Relation with statistical mechanics 311
 - 1.4. String-like excitations 314
- 2. Particles with spin and path integral representation 315
- 3. Spin factor and fermionic integral 324
- 4. 2D surfaces and strings 328
- 5. Fermionic determinants 333
- 6. Dynamical gauge fields 339
- 7. Two-dimensional quantum gravity 349
- 8. More on 2D quantum gravity 351
- 9. High T_d superconductivity 358
- 10. Anomalous dimensions of operators 363

Course 5. Exactly solvable models of 2D-quantum gravity on the lattice, by V.A. Kazakov 369

- 1. Lattice formulation of 2D-quantum gravity with various matter fields and review of the results 373
- 2. Statistical models on the dynamically triangulated planar lattice (DPL-models) 382
- References 391

Seminar 3. Conformal invariance, self-avoiding walks in the plane or on a random surface, by B. Duplantier 393

- 1. Introduction 395
- 2. Polymers in the plane 396
 - 2.1. Watermelon topology 396
 - 2.2. $O(n)$ model and Coulomb gas technique 398
- 3. Polymers on a two-dimensional random lattice 400
 - 3.1. The model 400
 - 3.2. Critical behaviors 403
- 4. Conformal invariance on a random surface 404
- 5. Higher topologies 406
- References 407

Course 6. Some topics in string theory, by A. Neveu	409
1. Introduction	413
2. Descriptive properties of strings	414
2.1. Basic ingredients of free bosonic strings	414
2.2. Basic ingredients of free superstrings	416
3. String Interactions	418
3.1. Elementary vertex operators	418
3.2. The Koba-Nielsen formula and its interpretation	419
3.3. Covariant quantization of the bosonic string	420
4. String field theory	423
4.1. Motivation	423
4.2. Light-cone string field theory	423
4.3. Lorentz covariant free string field theory	424
4.4. Interacting gauge covariant strings	428
4.5. Superstring field theories	430
5. Group theoretic approach to strings	431
5.1. Motivation and overview	431
5.2. Overlaps	432
5.3. Determination of the integration measure	434
5.4. String vertices as induced representations	436
References	437
Course 7. Space-time supersymmetry, effective Lagrangians, and the <i>moduli</i> space of <i>superconformal</i> field theories, by S. Ferrara	441
Summary of the Lectures	443
References	447
Course 8. <i>Selected</i> topics in lattice field theory, by M. Luscher	451
1. Introduction	455
2. Particle scattering in euclidean lattice theories	457
2.1. Construction and interpretation of the transfer matrix	457
2.2. Localized one-particle states	461
2.3. Scattering states	467
2.4. LSZ type formula for the scattering matrix	469
3. Renormalization and continuum limit in perturbation theory	474
3.1. Examples and introductory remarks	474
3.2. Structure of lattice Feynman integrals	477
3.3. Degrees of divergence	480
3.4. The Reisz power counting theorem	482

3.5. Gauge fixing and BRS symmetry on the lattice	484
Appendix 1. Proof of the lattice power counting theorem for $L = 1$	494
4. Finite size effects in massive theories	497
4.1. Basic facts	497
4.2. Volume dependence of stable particle masses in simple models	500
4.3. Models with a spontaneously broken discrete symmetry	503
4.4. The case of (pure) non-Abelian gauge theories	507
4.5. Two-particle states in finite volume	515
4.6 Resonances	519
References	525

Course 9. Principles of numerical simulations, by G. Parisi 529

1. Introduction	533
2. The floating numbers	534
3. Random numbers	535
4. Solving differential equations	538
5. Simulating statistical mechanics	540
6. Preliminaries on field theories	543
7. Pure gauge QCD: the spectrum	545
8. The deconfinement transition in pure gauge QCD	552
9. Quenched fermions	556
10. Open problems	560
References	561

Course 10. Field theory methods and quantum critical

1. Introduction	567
2. Spin-wave theory for the Heisenberg model [1]	569
3. Large-s mapping onto the O(3) non-linear g-models [5]	575
4. Behavior of the O(3) non-linear a-model: hints from the renormalization group, large-n limits and exact S-matrix	579
5. The Lieb-Shultz-Mattis theorem	585
6. Spin-1/2 chain by Jordan-Wigner transformation	588
7. The Hubbard model-large-U limit and spin-density-wave mean field theory	600
8. Non-abelian bosonization of the Hubbard model	606
9. Higher spin, Bethe ansatz and finite-size scaling	614
Appendix 1. Notation, free fermion and free boson field theories...	634
References	639

Course 11. Strings by Dan Friedan 641
