<i>Preface</i>	vi
<i>Introduction</i>	1
Chapter 1 The Process Region	5
1.1 Introduction..	5
1.2 Micro-separations and coalescences	5
General considerations.	5
Dominant kernels of micro-separation.	7
The significance of an intrinsic material length parameter	8
Micro-separations and coalescences in metallic polycrystalline materials	9
Micro-separations and coalescences in ceramics	11
Micro-separations and coalescences in polymers	12
Micro-separations and coalescences in composites	13
Necking near a crack edge in thin sheets and plates.	13
1.3 The cell model of materials	15
1.4 Definition of the process region.	18
1.5 Dimensions of the process region	20
1.6 Models of the process region	22
1.7 Experimental observations	25
Chapter 2 The Fracture Process	27
2.1 Introduction	27
2.2 Pre-existing cracks	27
2.3 Loading before crack growth	29
2.4 Onset of crack growth.	30
2.5 Stable crack growth	31
General properties of stable crack growth	31
Measurement of the amount of crack growth.	33
2.6 Onset of unstable crack growth.	35
2.7 Unstable crack growth	36
General considerations.	36
Crack growth direction	37
Branching	38
2.8 The plastic region and its wake	39
General considerations.	39

	The plastic region before unstable crack growth.	39
	The plastic region during crack growth	43
	The wakes of the primary plastic region and the process region; the secondary plastic region	44
Chapter 3 Basic Relations in Crack Mechanics		45
3.1	Introduction..	45
	General considerations	45
	Boundary conditions	45
	The three symmetry modes	46
3.2	Path-independent integrals	48
	General considerations	48
	A path-independent integral for plates	49
	The J -integral	52
	Extension to the plastic region at a stationary crack.	53
	Moving cracks: the steady state approximation	54
	Energy flow to the crack edge region	55
	Interpretation of the P - and J -integrals as energy flux at steady crack edge motion	57
	Estimates of P - or J -integrals for stationary cracks from load- displacement curves	59
	The path-independent M -integral	61
	The J -integral for anti-plane shearing and for axisymmetric cases	63
	A path-independent integral for stationary cracks in dynamic fields. ..	66
	A path-area integral incorporating inelastic strains, inertia and body forces	67
3.3	Stress-strain field at small scale yielding	67
	General considerations.	67
	Importance and dominance of inverse square-root terms.	68
	The autonomy	73
	The stress intensity factor.	74
	Dominating terms in modes I and II.	77
	The universal character of the asymptotic stress fields	83
3.4	Cracks in non-linear elastic environments	84
3.5	Results based on energy considerations	85
	Energy flow to the crack edge	85
	Interpretation of the Nilsson integral	90
	Weight functions.	90
	Weight functions for stationary cracks, subjected to dynamic loading .	94
	Weight functions for moving cracks.	95
3.6	The Barenblatt model	95
Chapter 4 Elastostatic Cracks		99
4.1	Introduction..	99
4.2	Eigenfunction expansions	99
4.3	Complex potentials for anti-plane strain	103
	Basic equations..	103
	Mode III cracks	105

	Infinite body	106
	Finite outer dimensions.....	110
4.4	Complex potentials for in-plane problems	
	Basic equations.....	
	An alternative formulation: the Westergaard method	114
	Westergaard method for mode I	115
	Westergaard method for mode II	121
	The basic equations for in plane loading in polar coordinates	125
4.5	Conformal mapping.....	126
	General considerations.....	126
	Mode III crack in a long strip	127
	The elliptic hole approach.....	130
4.0	Some applications of complex potentials	132
	The canonical problem in the theory of cracks and fracture.....	132
	The mode II counterpart.....	135
	The mode III counterpart	135
	Energy relations	136
	Loads other than remote stresses	138
	Arrays of cracks	140
	Circular arc crack.....	
4.7	Integralequations	142
	Superposition of elementary loads	148
	Arrays of dislocations.....	152
	Dislocation arrays in finite and semi-infinite regions	155
4.8	Dual integral equations	160
4.9	Wiener-Hopf technique	163
	General considerations.....	163
	A mode I edge crack in a large plate	164
	Slanting edge crack.....	169
4.10	Kinked and branched cracks	171
	The origin of kinked cracks.....	171
	The infinitesimal kink	171
	Branchedcracks	173
4.11	Directional stability of cracks	174
4.12	Interface cracks	177
	General considerations.....	177
	The interface crack under in-plane deformation	178
	The interface crack under anti-plane strain	185
	Crack perpendicular to an interface	186
4.13	Three-dimensional crack problems	190
	Introduction.....	190
	The elliptic crack	191
	Cracks in curved shells	191
	Semi-infinite plane crack subjected to crack face loading	192
	Crack with slightly curved front	201
	Crack in a plate with consideration of transverse shear	205
14	Cracks in anisotropic linearly elastic media	206

	Introduction	20 6
	General relations	20 7
	Plane cases.....	21 0
	Basic relations for cracks in anisotropic media	215
	Cracks under anti-plane strain	215
	Cracks under generalized plane strain.	216
	Interface cracks..	226
	Interface crack subjected to remote loading.	234
4.15	Cracks in isotropic visco elastic media	236
	General definitions and relations	236
	Visco elastic models.	238
	The elastic-viscoelastic correspondence principle	238
	Stationary cracks	239
	Slowly propagating crack	243
	Energy flow into a cohesive region.	244
	Chapter 5 Elastoplastic Stresses and Strains	247
5.1	Introduction	247
5.2	Basic relations	248
5.3	Stationary mode III cracks	254
	General considerations for perfect plasticity	254
	The hodograph transform	258
	The Hult-McClintock problem	260
	Large scale yielding at a mode III crack in a finite elastic-perfectly plastic body	263
	Loss of autonomy at large scale yielding	268
	Conditions under which proportional loading prevails in the plastic region	27 0
	Mode III small scale yielding in strain hardening materials	271
	Strains in the crack edge vicinity at large scale yielding in strain hardening materials.	273
	A note on the near edge autonomy for mode III elastic-plastic cracks ..	276
	Matching solutions for elastic and plastic regions.	276
	Fully plastic solutions	277
5.4	Stationary mode I cracks..	278
	Cracks in perfectly plastic materials. Slip line solutions	278
	Cracks in strain hardening materials.	285
	Mode I plastic region at small scale yielding	290
	The mode I Leonov-Panasyuk-Dugdale model	292
5.5	Stationary mode II cracks	296
	Cracks in perfectly plastic materials. Slip line solutions	296
	The mode II Leonov-Panasyuk-Dugdale model.	297
5.6	Slowly moving mode III cracks	298
	General considerations for perfect plasticity and steady state	298
	Constant stress and centered fan stress sectors	299
	Stresses and strains in the primary plastic region.	300
	Stresses and strains in the secondary plastic region	302

	Assembly of sectors close to the crack edge	303
	Strain hardening.....	307
5.7	Slowly moving mode I and II cracks	308
	General considerations.....	308
	Constant stress and centered fan sectors	310
	The rate of deformation tensor	311
	Asymptotic deformations in centered fan sectors	312
	The asymptotic field in elastically deforming sectors	314
	Matching conditions at sector boundaries	315
	Assembly of sectors	320
	The significance of a finite process region	326
	Chapter 6 Elastodynamic Crack Mechanics	328
6.1	Introduction	328
6.2	The Yoffe problem.	330
	Introduction.....	330
	Statement of the mode II Yoffe problem	331
	Solution for a moving line load	332
	Solution of the mode II Yoffe problem	334
	The crack edge vicinity in modes I and II	336
	Crack face loads. The Craggs problem	344
6.3	Friction and cohesion in mode II crack propagation	345
	Sub-Rayleigh crack velocities	345
	Intersonic crack velocities	348
6.4	Steady state mode III crack propagation	356
6.5	Steady state crack propagation in anisotropic materials	360
6.6	Steady state crack propagation in viscoelastic materials	365
	Formulation of a Wiener-Hopf equation for mode III crack propagation.....	365
	Solution for the standard linear solid	367
	Solution for models other than the standard linear solid.	371
	Energy flux into the crack edge and energy dissipation	373
6.7	Crack propagation in a strip	375
6.8	Crack propagation along an interface	377
	Introduction.....	377
	The subsonic anti-plane case	377
	The subsonic in-plane case	379
	The intersonic in-plane case	386
	The subsonic/supersonic anti-plane case	390
	The subsonic/intersonic in-plane case	394
6.9	Crack expanding with constant velocity	398
	Self-similar dynamic problems	398
	Symmetric mode I crack expansion	402
	Symmetric and nonsymmetric mode II crack expansion	414
	Intersonic mode II crack expansion	419
	Symmetric mode III crack expansion	422
	Self-similar expansion of circular and elliptic cracks	426
6.10	Face loaded mode III cracks	428

A general remark	428
A self-similar problem with wide applicability	428
Superposition of elementary solutions.	434
Moving pair of opposed concentrated crack face forces	434
General time-independent crack face loading.	435
Crack motion from an equilibrium state.	436
Time-dependent crack face loads	438
6.11 Face loaded in-plane mode cracks.....	43 9
Face loaded mode I cracks	440
Face loaded mode II cracks	448
Moving pair of opposed concentrated crack face forces	449
General time-independent in-plane mode crack face loading	450
In-plane mode crack motion from an equilibrium state	450
Self-similar time-dependent crack face loading	451
General time-dependent crack face loading	451
6.12 Non-constant crack velocity and crack arrest	456
Sudden arrest of a mode III crack subjected to crack face loading	457
Sudden arrest of in-plane mode cracks	463
Crack growth at non-constant velocity	464
Sudden change of crack speed	467
Arrest from steady state crack propagation.	467
Arrest of an expanding crack	468
6.13 Stress wave loading of cracks.	469
General considerations.....	46 9
Step function SH wave impinging on a crack.	470
Step function SV wave impinging on a crack.	472
Step function P wave impinging on a crack	473
Crack growth after a delay time	474
Crack arrest after stress pulse loading	481
Non-constant crack velocity after stress pulse loading	483
Stress wave incidence on a crack of finite length.	486
Stress wave incidence on a crack in a strip	488
6.14 Three-dimensional elastodynamic crack problems	491
Oblique P wave incidence on a crack edge	491
Three-dimensional face loading on semi-infinite cracks	499
General three-dimensional loading on planar cracks.	501
Chapter 7 Elastoplastic Crack Dynamics	509
7.1 Introduction..	509
7.2 Mode III crack propagation.	510
Governing equations.....	51 0
Asymptotic solution.....	51 1
Solution for the symmetry plane ahead of the crack	514
The paradox resolved	519
On the validity of asymptotic analyses. Stahle's solution	521
7.3 Asymptotic solutions for in-plane crack propagation	522
General relations.....	52 2

	Asymptotic solution for mode I	525
	Asymptotic solution for mode II	531
7.4	Temperature changes at moving crack edges	536
	General considerations	536
	Heat conduction and temperature distribution near a moving crack edge	539
Chapter 8 Physical and Engineering Aspects of Fracture		544
8.1	Introduction	544
8.2	Processes in the crack edge vicinity	545
	Void growth	545
	Internal local instability in a continuum model	552
	Localization of plastic flow in shear	556
	Competition between decohesion and plastic flow	556
	Competition between cleavage and plastic flow at a crack edge	562
	Cleavage cracking in the presence of plastic flow	563
	Toughening mechanisms	565
	Fractal models for cracks	572
	Fracto-emission	573
8.3	Prediction of onset of crack growth	574
	General considerations. The concept of autonomy before crack growth	574
	Small scale yielding	575
	Large scale yielding	577
8.4	Prediction of fracture	579
	Global versus local criteria	579
	Small scale yielding	581
	Large scale yielding	587
	Dependence on plate thickness	595
8.5	Weibull's statistical theory of the strength of materials	596
	Introduction	596
	Weibull's theory	597
	Prediction of ductile-brittle transition, using Weibull statistics	600
8.6	Crack directions	603
	Introduction	603
	Crack directions under small scale yielding	606
	Crack growth in compression	609
	Directional stability during wedging	613
8.7	Applications to engineering	614
	Introduction	614
	Linear elastic fracture mechanics	615
	The J-resistance curve method	615
	The <i>J-N</i> method	616
Chapter 9 Dynamic Processes in Fracture Mechanics		625
9.1	Dynamic crack propagation	625
	Introduction	625
	The crack edge equation of motion	629
	A model for dynamic crack propagation	630

	Simulations, using the cell model.	635
	Other simulations of dynamic crack propagation	637
	Dynamic crack propagation in viscoplastic materials.	638
	Dynamic crack propagation in modes II and III. Shear banding	642
9.2	Branching.	646
	Introduction.	646
	A hypothesis	646
	Branching symmetry	648
	Attempted branching	649
	Branching synchronicity	650
	Macroscopic criteria for the onset of branching.	651
	Simulations of branching.	652
9.3	The maximum crack velocity.	653
	Mode I	653
	Modes II and III.	654
9.4	Crack arrest	655
	Situations in which a running crack may be arrested.	655
	Conditions for crack arrest	656
	Re-initiation	657
	The crack arrest stress intensity factor	658
	The role of the kinetic energy in crack arrest	659
	Appendices	661
A1	Formulae and general relations	661
	Vector operations	661
	Displacements and stresses expressed by displacement potentials	662
	Elastic constants	664
A2	The first boundary value problem for the half-plane.	665
	In-plane problem.	665
	Anti-plane problem	667
A3	Some formulae related to the Airy stress function.	668
	Representation of stresses	668
	Representation of strains and displacements at linear elasticity.	668
	Equation and basic solutions	669
	Solutions for the vicinity of crack edges or sharp notches	669
A4	Analytic functions	670
	Definition. Cauchy-Riemann equations	670
	Singular points	671
	Power series representation. Analytic continuation.	672
	Connection with Fourier series	674
	Cauchy's integral theorem.	674
	Cauchy's integral formula	675
	Plemelj's formulae	677
	Liouville's theorem	678
	Decomposition of analytic functions	679
A5	Laplace transforms	680
	One-sided Laplace transforms	680

CONTENTS

xiii

	Two-sided Laplace transforms	682
	Asymptotic relations	683
A6	Mellin transforms	684
A7	Hankel transforms	684
A8	Stresses near a sharp notch	685
A9	Basic relations for stress waves in elastic solids	687
	Basic equations for motion. The two fundamental wave types	687
	Waves from an embedded point source.	690
	Wave guides	691
	Waves in plane strain or plane stress	691
	Surface waves – Rayleigh waves	694
	Waves in linearly elastic anisotropic media	696
A10	Formulae related to path-independent integrals.	697
	Energy flow to the process region	697
	Relations between <i>P</i> - or <i>J</i> -integrals and load-displacement records ...	699
	References	702
	<i>Index</i>	73 ³
