CONTENTS

PREFACE vii

1
PRELIMINARIES ON HOMOTOPY THEORY 1

1. Category theory and homotopy theory 1
2. Complexes 2
3. The spaces Map (X, Y) and Map_0 (X, Y) 4
4. Homotopy groups of spaces 6
5. Fibre maps 7

PART I
THE GENERAL THEORY OF FIBRE BUNDLES

2
GENERALITIES ON BUNDLES 11

1. Definition of bundles and cross sections 11
2. Examples of bundles and cross sections 12
3. Morphisms of bundles 14
4. Products and fibre products 15
5. Restrictions of bundles and induced bundles 17
6. Local properties of bundles 20
7. Prolongation of cross sections 20

Exercises 22

3
VECTOR BUNDLES 23

1. Definition and examples of vector bundles 23
2. Morphisms of vector bundles 25

3. Induced vector bundles 26
4. Homotopy properties of vector bundles 27
5. Construction of Grassmann maps 29
6. Homotopies of Grassmann maps 31
7. Functorial description of the homotopy classification of vector bundles 32
8. Kernel, image, and cokernel of morphisms with constant rank 34
9. Riemannian and Hermitian metrics on vector bundles 35
Exercises 37

4
GENERAL FIBRE BUNDLES 39

1. Bundles defined by transformation groups 39
2. Definition and examples of principal bundles 40
3. Categories of principal bundles 41
4. Induced bundles of principal bundles 42
5. Definition of fibre bundles 43
6. Functorial properties of fibre bundles 45
7. Trivial and locally trivial fibre bundles 46
8. Description of cross sections of a fibre bundle 46
9. Numerable principal bundles over $B \times [0, 1]$ 48
10. The cofunctor k_G 51
11. The Milnor construction 52
12. Homotopy classification of numerable principal G-bundles 54
13. Homotopy classification of principal G- bundles over CW- complexes 57
Exercises 57

5
LOCAL COORDINATE DESCRIPTION OF FIBRE BUNDLES 59

1. Automorphisms of trivial fibre bundles 59
2. Charts and transition functions 60
3. Construction of bundles with given transition functions 62
4. Transition functions and induced bundles 63
5. Local representation of vector bundle morphisms 64
6. Operations on vector bundles 65
7. Transition functions for bundles with metrics 67
Exercises 69

6
CHANGE OF STRUCTURE GROUP IN FIBRE BUNDLES 70

1. Fibre bundles with homogeneous spaces as fibres 70
2. Prolongation and restriction of principal bundles 71
3. Restriction and prolongation of structure group for fibre bundles 72
4. Local coordinate description of change of structure group 73

5. Classifying spaces and the reduction of structure group 73
Exercises 74

7

CALCULATIONS INVOLVING THE CLASSICAL GROUPS 75

1. Stiefel varieties and the classical groups 75
2. Grassmann manifolds and the classical groups 78
3. Local triviality of projections from Stiefel varieties 79
4. Stability of the homotopy groups of the classical groups 82
5. Vanishing of lower homotopy groups of Stiefel varieties 83
6. Universal bundles and classifying spaces for the classical groups 83
7. Universal vector bundles 84
8. Description of all locally trivial fibre bundles over suspensions 85
9. Characteristic map of the tangent bundle over S^n 86
10. Homotopy properties of characteristic maps 89
11. Homotopy groups of Stiefel varieties 91
12. Some of the homotopy groups of the classical groups 92
Exercises 95

PART II

ELEMENTS OF *K*-THEORY

8

STABILITY PROPERTIES OF VECTOR BUNDLES 99

1. Trivial summands of vector bundles 99
2. Homotopy classification and Whitney sums 100
3. The K cofunctors 102
4. Corepresentations of $\tilde{K}_F$ 105
5. Homotopy groups of classical groups and $\tilde{K}_F(S^i)$ 108
Exercises 109

9

RELATIVE K-THEORY 110

1. Collapsing of trivialized bundles 110
2. Exact sequences in relative K-theory 112
3. Products in K-theory 116
4. The cofunctor $L(X, A)$ 117
5. The difference morphism 119
6. Products in $L(X, A)$ 121
7. The clutching construction 122
8. The cofunctor $L_n(X, A)$ 124
9. Half-exact cofunctors 126
Exercises 127

10
BOTT PERIODICITY IN THE COMPLEX CASE 128

1. K-theory interpretation of the periodicity result 128
2. Complex vector bundles over X X S^2 129
3. Analysis of polynomial clutching maps 131
4. Analysis of linear clutchings 133
5. The inverse to the periodicity isomorphism 136

11
CLIFFORD ALGEBRAS 139

1. Unit tangent vector fields on spheres: I 139
2. Orthogonal multiplications 140
3. Generalities on quadratic forms 141
4. Clifford algebra of a quadratic form 144
5. Calculations of Clifford algebras 146
6. Clifford modules 149
7. Tensor products of Clifford modules 154
8. Unit tangent vector fields on spheres: II 156
9. The group Spin(k) 157
Exercises 158

12
THE ADAMS OPERATIONS AND REPRESENTATIONS 159

1. A-rings 159
2. The Adams +-operations in X-ring 160
3. The γ^i operations 162
4. Generalities on G-modules 163
5. The representation ring of a group G and vector bundles 165
6. Semisimplicity of G-modules over compact groups 166
7. Characters and the structure of the group $R_F(G)$ 168
8. Maximal tori 169
9. The representation ring of a torus 172
10. The $-operations on $K(X)$ and $KO(X)$ 173
11. The ψ-operations on $\tilde{K}(S^n)$ 175

13
REPRESENTATION RINGS OF CLASSICAL GROUPS 176

1. Symmetric functions 176
2. Maximal tori in $SU(n)$ and $U(n)$ 178
3. The representation rings of $SU(n)$ and $U(n)$ 179
4. Maximal tori in $Sp(n)$ 180
5. Formal identities in polynomial rings 180
6. The representation ring of $Sp(n)$ 181

7. Maximal tori and the Weyl group of SO(n) 182
8. Maximal tori and the Weyl group of Spin(n) 183
9. Special representations of SO(n) and Spin(n) 184
10. Calculation of $RSO(n)$ and $R\mathrm{Spin}(n)$ 187
11. Relation between real and complex representation rings 190
12. Examples of real and quaternionic representations 193
13. Spinor representations and the K-groups of spheres 195

14

THE HOPF INVARIANT 196

1. K-theory definition of the Hopf invariant 196
2. Algebraic properties of the Hopf invariant 197
3. Hopf invariant and bidegree 199
4. Nonexistence of elements of Hopf invariant 1 201

15

VECTOR FIELDS ON THE SPHERE 203

1. Thom spaces of vector bundles 203
2. S-category 205
3. S-duality and the Atiyah duality theorem 207
4. Fibre homotopy type 208
5. Stable fibre homotopy equivalence 210
6. The groups $J(S^k)$ and $\tilde{K}_{\mathrm{Top}}(S^k)$ 211
7. Thorn spaces and fibre homotopy type 213
8. S-duality and S-reducibility 215
9. Nonexistence of vector fields and reducibility 216
10. Nonexistence of vector fields and coreducibility 218
11. Nonexistence of vector fields and $J(RP^k)$ 219
12. Real K-groups of real projective spaces 222
13. Relation between $KO(RP^n)$ and $J(RP^n)$ 223

PART III

CHARACTERISTIC CLASSES

16

CHERN CLASSES AND STIEFEL-WHITNEY CLASSES 229

1. The Leray-Hirsch theorem 229
2. Definition of the Stiefel-Whitney classes and Chern classes 230
3. Axiomatic properties of the characteristic classes 232
4. Stability properties and examples of characteristic classes 234
5. Splitting maps and uniqueness of characteristic classes 235
6. Existence of the characteristic classes 236

7. Fundamental class of sphere bundles. Gysin sequence 237
8. Multiplicative property of the Euler class 339
9. Definition of Stiefel-Whitney classes using the squaring operations of Steenrod 241
10. The Thorn isomorphism 241
11. Relations between real and complex vector bundles 242
12. Orientability and Stiefel-Whitney classes 244
Exercises 244

17
DIFFERENTIABLE MANIFOLDS 246

1. Generalities on manifolds 246
2. The tangent bundle to a manifold 248
3. Orientation in euclidean spaces 249
4. Orientation of manifold8 251
5. Duality in manifolds 253
6. Thorn class of the tangent bundle 255
7. Euler characteristic and class of a manifold 257
8. Wu's formula for the Stiefel-Whitney class of a manifold 259
9. Stiefel-Whitney numbers and cobordism 260
10. Immersions and embeddings of manifolds 261
Exercises 262

18
GENERAL THEORY OF CHARACTERISTIC CLASSES 264

1. The Yoneda representation theorem 264
2. Generalities on characteristic classes 265
3. Complex characteristic classes in dimension n 266
4. Complex characteristic classes 267
5. Real characteristic classes mod 2 269
6. 2-divisible real characteristic classes in dimension n 271
7. Oriented even-dimensional real characteristic classes 274
8. Examples and applications 276
9. Bott periodicity and integrality theorems 277
10. Comparison of K-theory and cohomology definitions of Hopf invariant 278
11. The Borel-Hirzebruch description of characteristic classes 279

appendix: Dold's theory of local properties of bundles 282

bibliography 284

index 293
