CONTENTS

rologue ix

hapter I. Simple Growth of Populations and Individuals 1

1.1. Population Growth 1
1.2. Multiple-Species Communities 5
1.3. Individual Growth 7
1.4. Multidimensional Growth in Individuals 9
1.5. A Plant Considered as a Population 11
1.6. A Simple Model of Tannin Production in a Plant 14
1.7. Volterra's Production Variable 15
Chapter Summary 18

hapter II. Competitive Interactions Between Two Species 21

2.1. Gause-Witt Competition 21
2.2. Hutchinson's Competition with Social Effects 28
Chapter Summary 32

hapter III. Medawar's Growth Energy and Optimal Production 35

3.1. Gompertz Growth and Medawar's Energy of Growth 35
3.2. The Calculus of Variations and Optimal Production 36
3.3. Laird's Law, The Principle of Maupertuis and Medawar's Energy 40
Chapter Summary 55

hapter IV. Predation and Herbivory on Optimally Producing Terrestrial and Marine Ecosystems 57

4.1. The Crown-of-Thorns Starfish Predation on G.B.R. 57
4.2. Optimal Defense Theory of Rhoades 62
4.3. Chemical Interactions Between Soft and Hard Corals – The Biology 68
4.4. Introduction to the Model Description of a Viable Community 71
4.5. Predictions on the Model 78
Chapter Summary 82

apter V. The Differential Geometry of Production Stability 85

5.1. Quadratic Maupertuis Energy 85
5.2. Non-Quadratic Maupertuis Energy 97
Chapter Summary 109

Chapter VI. A Dynamical Theory of Heterochrony: Time-Sequencing Changes in Ecology, Evolution and Development 1

6.1. Křivan's Growth Rate Transformation Defined by Ecological Constraints
6.2. Constraints on Production and the Projective Geometry of Sprays. The Adaptation Theorem
6.3. Division of Labour in Colonial Animals. Wilson's Ergonomics and Allometric Space
6.4. Social Interactions, Curvature and Complexity. Kwang Jeon's Experiment
6.5. Heterochrony and Environment in the Evolution of a Colonial Individual
6.6. Allometric Space and Wagner Geometry
6.7. Allometric Growth and Heterochrony in Paleontology
6.8. Remarks on the Dissociation of Growth, Maturation and Development in Ontogeny
6.9. Progenesis and Myxomatosis, The Wild Rabbit Disease
Chapter Summary

Appendix A: On the Fundamental Lemma of Variational Calculus

Appendix B: Fuzzy Differential Inclusions as Substitutes for Stochastic Differential Equations in Population Biology

1. Introduction
2. Fuzzy Differential Inclusions
3. An Example of Non-Riemannian Type
4. Targeting Growth in the Presence of Noise
5. Final Remarks
References

Appendix C: Normal Coordinates and Log-Biomass
