

CONTENTS

1	Introduction	1
1.1	Invitation	1
1.2	Introduction	4
1.3	Overview	8
1.4	Omissions	11
1.5	Related Reviews and Books	15
2	Review of Continuum Mechanics	17
2.1	Vectors and Matrices	17
2.2	Deformation	20
2.3	Deformation Gradient	22
2.4	Rotation and Stretch	26
2.5	Kinematic Compatibility	27
3	Continuum Theory of Crystalline Solids	29
3.1	Bravais Lattice	29
3.2	Deformation of Lattices and Symmetry	32
3.3	Lattice–Continuum Link: The Cauchy–Born Hypothesis	34
3.4	Energy Density in Crystalline Solids	36
3.5	Symmetry of Deformable Lattices: Ericksen–Pitteri Neighborhood	38
3.6	Multi-lattice	43
4	Martensitic Phase Transformation	46
4.1	Martensitic Phase Transformation; Bain or Transformation Matrix	46
4.2	Energy Density	58
4.3	Material Symmetry: Variants of Martensite	60
4.4	Frame-indifference: Energy Wells	62
4.5	Summary of the Energy Density	64
4.6	Multiple Transformations	65
5	Twinning in Martensite	66
5.1	Deformation Involving One Variant	66
5.2	Deformation Involving Two Variants	67

5.3	Interpretation as a Twin	68
5.4	Solution of the Twinning Equation and Classification of Twins	69
5.5	Cubic to Tetragonal Transformation	74
5.6	Cubic to Orthorhombic Transformation	75
5.7	Cubic to Monoclinic-I Transformation	78
5.8	Parallel Twins	80
5.9	Zig-zag Twins	81
5.10	Crossing Twins	83
6	Origin of Microstructure	86
6.1	Simplified Example in One Dimension	87
6.2	Simplified Example in Two Dimensions	89
6.3	Example in Three Dimensions: Fine Twins	93
6.4	Weakly Converging Sequences and Fine Microstructure	96
6.5	Relaxed Energy Density	98
6.6	Length-scale of the Microstructure	102
7	Special Microstructures	105
7.1	Austenite–Martensite Interface	106
7.1.1	Cubic to Tetragonal Transformation	114
7.1.2	Cubic to Orthorhombic Transformation	117
7.1.3	Cubic to Monoclinic-I Transformation	117
7.1.4	Remarks	118
7.2	Twins within Twins	121
7.3	Wedge-like Microstructure	124
7.3.1	Cubic to Tetragonal Transformation	127
7.3.2	Cubic to Orthorhombic Transformation	128
8	Analysis of Microstructure	131
8.1	Average Compatibility Conditions or the Minors Relations	131
8.2	Gradient Young Measure	141
9	The Shape-Memory Effect	143
9.1	Self-accommodation	144
9.1.1	Cubic Austenite	146
9.1.2	Tetragonal Austenite	148
9.1.3	Self-accommodating Plate Group	150
9.2	Recoverable Strains under Load Control	151
9.2.1	Uniaxial Loading	151
9.2.2	Biaxial Loading	153
9.3	Recoverable Strains under Displacement Control	154

10 Thin Films	159
10.1 A Theory of Thin Films	161
10.2 Deformations with One Variant or Phase	165
10.3 Deformations with Two Variants or Two Phases: Interface Conditions	166
10.4 Martensite–Martensite Interface	169
10.5 Austenite–Martensite Interface	170
10.6 Tents and Tunnels	171
11 Geometrically Linear Theory	178
11.1 Linearized Kinematics	178
11.2 Geometrically Linear Theory for Martensitic Phase Transformations	181
11.3 Some Microstructures and Comparisons	185
11.3.1 Twinning	185
11.3.2 Austenite–Martensite Interface	189
11.3.3 Wedge-like Microstructure	192
11.3.4 Zig-zag Twins	192
11.4 Recoverable Strains under Displacement Control	194
11.5 Self-accommodation	200
11.6 Recoverable Strains under Load Control	201
11.7 Accuracy of the Geometrically Linear Theory	202
12 Piecewise Linear Elasticity	204
12.1 Piecewise Quadratic Energy	204
12.2 Stress Due to Incompatible Phase Arrangement	209
12.3 Relaxed Energy Density	213
12.4 A Modified Variational Principle	219
12.5 Connection to Homogenization Theory and Optimal Design	222
13 Polycrystals	224
13.1 Examples	227
13.1.1 Bi-crystal	227
13.1.2 Triple Junction	234
13.2 Polycrystals	238
13.3 Recoverable Strains under Displacement Control	240
13.4 Recoverable Strains under Load Control	243
13.5 The Consequence of Symmetry	247
13.6 The Consequences of Texture	249
13.7 Energy Minimization and Recoverable Strain	261
Appendix	267
Bibliography	272
Index	287
