FOREWORD	vii
CHAPTER I. The approximation of algebraic irrationalities	1
§1. Introduction	1
§2. Auxiliary lemmas	11
§3. Fundamental theorems	21
§4. Applications of the fundamental theorems	35
CHAPTER II. Transcendence of values of analytic functions whose Taylor series have algebraic coefficients	41
§1. Introduction. The Hermite and Lindemann theorems	41
§2. Further development of the ideas of Hermite and Lindemann	50
§3. Auxiliary propositions and definitions	60
§4. General theorem on the algebraic independence of values of an E-function and consequences of it	78
§5. Problems concerning transcendence and algebraic independence, over the rational field, of numbers defined by infinite series or which are roots of algebraic or transcendental equations	93
CHAPTER III. Arithmetic properties of the set of values of an analytic function whose argument assumes values in an algebraic field; transcendence problems	97
§1. Integrity of analytic functions	97
§2. The Euler-Hilbert problem	102
§3. Problems concerning measure of transcendence and further development of methods	118
