<i>Preface</i>	page xiii
<i>Acknowledgments</i>	xvii
1 Introduction: Qualitative description and one-dimensional experiments	1
1.1 Qualitative features of adiabatic shear bands	2
1.1.1 Basic morphology	2
1.1.2 Occurrence	7
1.1.3 Importance	11
1.1.4 Qualitative mechanics	14
1.1.5 Reviews and symposiums on adiabatic shear	15
1.1.6 Implications for computations	17
1.2 One-dimensional experiments	18
1.2.1 Dynamic testing with uniform fields	19
1.2.2 Formation of adiabatic shear bands in thin-walled tubes and other geometries	26
1.3 Concluding remarks	34
2 Balance laws and nonlinear elasticity: A brief summary	35
2.1 Balance laws	36
2.1.1 Balance of mass	37
2.1.2 Balance of momentum	37
2.1.3 Balance of angular momentum	38
2.1.4 Balance of energy	38
2.1.5 The Clausius–Duhem inequality	39

2.2	Thermoelasticity	40
2.2.1	Objectivity and implications of the Clausius–Duhem inequality	40
2.2.2	Helmholz and Gibbs functions	42
2.2.3	Specific heat, thermal stress, and thermal expansion	44
3	Thermoplasticity	47
3.1	General structure	50
3.1.1	Kinematics	50
3.1.2	Thermodynamic potentials	53
3.1.3	Entropy and energy	55
3.2	Yield, plastic flow, and constitutive equations	58
3.2.1	The intermediate configuration and the local elastic reference configuration	58
3.2.2	Elastically isotropic materials with scalar internal variables only	60
3.2.3	Plastic stretching in elastically isotropic materials	62
3.2.4	Plastic yield	64
3.2.5	Constitutive laws for plastic flow	65
3.2.6	Flow potentials	68
3.3	One-dimensional forms	69
3.3.1	Specializations and approximations	69
3.3.2	Isotropic work hardening and the stored energy of cold work: An example	73
4	Models for thermoviscoplasticity	77
4.1	Work hardening	78
4.1.1	Work hardening without history effects	81
4.1.2	Quasi-static, isothermal stress–strain curves	81
4.1.3	Thermodynamic consistency of cold work and work hardening	84
4.2	Plastic flow: Simple phenomenological and physical models	85
4.2.1	Power law model	86
4.2.2	Litonski’s model	87
4.2.3	Johnson–Cook model	88
4.2.4	Zerilli–Armstrong models	89
4.2.5	Bodner–Partom model	92

4.2.6	MTS model	93
4.2.7	Anand's model	95
4.3	Concluding remarks	96
5	One-dimensional problems, part I: General considerations	98
5.1	Homogeneous solutions and the reduction to rigid-plastic material	98
5.1.1	Initial boundary layer: General description	99
5.1.2	Initial boundary layer: A simple example	100
5.2	Steady solutions	103
5.3	Change of type, regularization, and embedded change of type	106
5.4	Typical numerical results	108
6	One-dimensional problems, part II: Linearization and growth of perturbations	115
6.1	Perturbations from homogeneous solutions: Linearized equations	116
6.1.1	Frozen coefficients	116
6.1.2	The initial-boundary value problem for perturbations	118
6.2	Quasi-static solutions for special cases on a finite interval	122
6.2.1	Perfect plasticity with finite thermal conductivity	122
6.2.2	Work hardening without thermal conductivity: The early response	124
6.2.3	Work hardening without thermal conductivity: The response near peak homogeneous stress	129
6.2.4	Finite thermal conductivity and work hardening	131
6.2.5	Discussion of quasi-static solutions	133
6.2.6	Scaling laws and scaling parameters	136
6.3	Infinite domain: Band spacing and patterning	141
6.4	Concluding remarks	148
7	One-dimensional problems, part III: Nonlinear solutions	150
7.1	Adiabatic cases; $k = 0$	150
7.1.1	Stress boundary condition	150

7.1.2	Velocity boundary condition; Wright (1990a,1990b)	151
7.1.3	Graphical interpretation of solutions	152
7.2	Finite thermal conductivity; $k \neq 0$	156
7.2.1	An exact solution	156
7.2.2	Approximate solution with no work hardening	158
7.2.3	Further approximations and qualitative interpretation	160
7.3	Multiple-length scales: Structure of a fully formed band and the evolution of stress in a special case	163
7.4	Canonical structure of a fully formed band in the general case	168
7.5	Thermal and mechanical length scales	176
7.6	DiLellio and Olmstead's theory of shear band evolution	177
7.7	Concluding remarks	180
8	Two-dimensional experiments	183
8.1	Kalthoff's experiment	183
8.1.1	Stable–brittle–ductile behavior	184
8.1.2	Brittle behavior	185
8.1.3	Ductile behavior	187
8.1.4	Other results and discussion	187
8.2	Thick-walled torsion experiments	189
8.3	Collapse of a thick-walled cylinder	193
9	Two-dimensional solutions	201
9.1	Mode III: Antiplane motion	202
9.1.1	Inertial solution	203
9.1.2	Core solution	208
9.2	Mode II: In-plane motion	211
9.3	The leading boundary layer	218
9.4	Summary	227
	<i>Bibliography</i>	229
	<i>Index</i>	239
