Preface to Third Edition	xv
--------------------------------	----

Chapter I

Thermodynamics of Phases having Constant Composition 1

Introduction	1
1. Thermodynamic potentials	3
1.1. Energy	3
1.2. Entropy	6
2. Polymorphism	11
2.1. Phase transitions on varying the temperature	11
2.2. Phase transitions on varying the pressure	14
2.3. P-T phase diagram	15
2.4. Effect of magnetic entropy on polymorphic transitions	18
2.5. Melting transition in hard sphere system	19
2.6. Polymorphs of a 2D system	21
2.7. Disordered, short-ranged-ordered and long-range-ordered solid solutions of invariant composition	24
2.8. Polymorphism in oligomers and polymers	31
2.8.1. Phase transitions of isolated polymers and oligomers	33
2.8.1.1. Coil to globule transition	34
2.8.1.2. Coil to lamellar crystal transition	37
2.8.1.3. Coil to helix transition	43
3. Summary	45
Appendix 1	46
Appendix 2	49
Appendix 3	52
Appendix 4	53
References	55
Bibliography	57
Problems	61

Chapter II**Thermodynamics of Solid Solutions 63**

Introduction	63
1. Random solutions in binary systems	63
1.1. Free energy of a random binary solution	63
1.2. Free energy of a mixture of solutions	65
1.3. Phase boundary compositions corresponding to miscibility gap compositions of a random binary solution	67
1.4. Regular solutions	70
1.5. Equilibrium between terminal solutions of different crystal structure	71
2. Non-random binary solid solutions	73
2.1. Positional entropy or entropy of mixing	73
2.2. Other contributions to the entropy of solution	74
3. Concept of strain energy in solid solutions	74
3.1. Metallic alloys	74
3.2. Semiconductor alloys	77
4. Factors other than atomic size deviation that affect the enthalpy and entropy of solid solutions	78
5. Activity and activity coefficient of solutions	80
6. Polymer alloys	81
7. Equilibrium in a stressed solid	82
8. Remarks about liquid solutions	84
9. Hard sphere fluid in a cell model	84
10. Summary	87
Appendix 1	87
References	88
Bibliography	89
Problems	90

Chapter III**Free Energy and Phase Diagrams 91**

Introduction	91
A. Free Energy and Phase Diagrams – Binary Systems	91
1. Solid–liquid equilibria	91
1.1. Phase boundary compositions and their distribution coefficient	91
1.2. Composition dependence of “average” of solidus and liquidus temperatures	92
2. Origin of eutectic phase diagram in isomorphous systems	96
3. Solid–solid equilibria equivalent to the solid–liquid case	98
4. Intermediate phases	99

5. Metastability	102
6. Temperature dependence of free energy–composition curves and phase diagrams	103
7. Prediction of phase diagrams	105
7.1. CALPHAD procedures	105
7.2. Thermodynamic integration and quasiharmonic lattice dynamics methods of evaluating free energy	108
8. Coherent equilibrium	109
9. Summary for Section A	110
B. Heterogeneous Chemical Equilibria and Phase Diagrams	110
1. Thermodynamics of heterogeneous chemical reactions	110
References	114
Bibliography	115
Problems	115

Chapter IV

Thermodynamics of Interfaces 117

Introduction	117
1. Concept of surface quantities	117
2. An approximate model for evaluating the surface energy	118
2.1. Wulff plot of surface energy	118
3. Surface reconstruction	120
4. Some particle size effects	121
4.1. Effect of particle size on difference in pressure between a small spherical isotropic solid and an external fluid in local equilibrium	121
4.2. Effect of particle size on difference in pressure between a crystal particle that develops surface facets and external fluid in local equilibrium	122
4.3. Dependence of equilibrium vapor pressure on particle size	122
4.4. Dependence of solvus composition on precipitate particle size	124
5. Adsorption	127
5.1. Gibbs' adsorption	127
5.2. Guggenheim's pseudo-thermodynamic model of an interface phase	129
5.3. Other adsorption isotherms	133
6. Surface stress	134
7. Surface energies or solid–gas and liquid–gas interface energies	135

8. Solid-liquid interfaces	137
9. Solid-solid interfaces	138
9.1. Grain boundaries	138
9.2. Interphase interfaces	142
9.3. Local equilibrium at grain boundary intersections	144
10. Diffuse interfaces	146
11. Methods of measuring interface energies	149
12. Pseudomorphic stabilization of metastable phases in thin films	150
13. Wetting transition	152
14. Soft matter interfaces	155
References	155
Bibliography	156
Problems	157

Chapter V

Heterophase and Homophase Fluctuations 159

Introduction	159
1. Heterophase fluctuations	159
1.1. Heterogeneous distributions of heterophase fluctuations	164
1.2. Effect of stress on fluctuation probability and embryo shape	167
2. Homophase fluctuations of composition in a metastable homogeneous phase	170
3. Spinodals and their relationship to mode of metastable phase decomposition	176
4. Easy embryo formers in stable host phases	176
Appendix 1	180
References	181
Bibliography	182
Problems	182

Chapter VI

Thermodynamics of Defects 185

Introduction	185
1. Monatomic solids	185
1.1. Point defects	185
1.2. Electronic defects	189
1.2.1. Intrinsic semiconductors	189
1.2.2. Extrinsic semiconductors	191

2. Compounds 194
 2.1. Defects in stoichiometric compounds 194
 2.2. Non-stoichiometric compounds 196
 3. Comparison of defects in metals, semiconductors and ionic crystals 203
 4. Average free energy of defects 203
 References 204
 Bibliography 204
 Problems 204

Chapter VII

Concepts in Kinetics in Solids 207

Introduction 207
 1. Activation energy 207
 2. Computer assisted methods in kinetics 212
 3. Competing processes 214
 4. Thermodynamic theory of irreversible processes 215
 5. Computer simulation methods 219
 5.1. Monte Carlo 219
 5.2. Molecular dynamics 221
 5.3. Phase field 221
 5.4. Level set 222
 References 222
 Bibliography 223
 Problems 223

Chapter VIII

Diffusion 225

Introduction 225
 1. Phenomenological basis 225
 1.1. Intrinsic diffusivities 225
 1.2. Chemical diffusivity 229
 1.3. Darken's relations 232
 1.4. Additional driving forces 233
 1.5. Applications of phenomenological equations of irreversible thermodynamics to ionic crystals 234
 2. Mechanisms of diffusion 234
 2.1. Metals 235
 2.1.1. Pure metals 235
 2.1.2. Dilute alloys 239

2.1.3. Ordered alloys/intermetallic compounds	240
2.1.4. Amorphous metals	242
2.2. Ionic crystals	242
2.2.1. Stoichiometric-cation vacancy predominant defect	242
2.2.2. General case	243
2.3. Semiconductors	245
3. Nernst–Einstein relation	245
4. Empirical rules	247
5. Solutions to diffusion equations	247
6. High diffusivity regions in solids	248
6.1. Models for evaluating the grain boundary diffusivity	249
6.2. Mechanism of diffusion along grain boundaries	251
6.3. Empirical results	251
6.3.1. Metals	251
6.3.2. Ionic crystals	251
6.4. Electromigration along grain boundaries	252
7. Computer assistance in solving diffusion problems	252
8. Polymer diffusion	254
Appendix 1	257
References	259
Bibliography	260
Problems	261

Chapter IX

Nucleation and Growth Kinetics 263

Introduction	263
1. Rate of heterophase nucleation	263
1.1. Homogeneous nucleation theory and its experimental verification	263
1.1.1. Temperature dependence of the steady-state nucleation rate ...	269
1.2. Heterogeneous nucleation	270
2. Spinodal decomposition	271
3. Nucleation at high supersaturation but not beyond spinodal	274
3.1. DFT and nucleation	276
4. Growth from nucleation onwards	281
5. Summary	284
References	285
Bibliography	286
Problems	287

Chapter X**Solid-Solid Interface Migration Kinetics 289**

Introduction	289
1. Driving forces for recrystallization and grain growth	289
2. Growth laws for pure materials	292
2.1. Primary recrystallization	292
2.2. Secondary recrystallization or abnormal grain growth	295
2.3. Grain growth	296
2.4. A/ α solid phase epitaxy	298
3. Effect of dispersed particles on grain boundary migration	298
4. Grain boundary mobility	299
5. Mechanisms of interface migration	303
5.1. Grain boundaries	303
5.1.1. Pure materials	303
5.1.2. Homogeneous alloys	307
5.2. Boundaries between different phases	307
5.2.1. Amorphous/crystal interface migration	307
5.2.2. Partitionless transformations	308
5.3. Effect of interface roughness on migration mechanism	309
5.4. Effect of solute on boundary mobility	310
6. Summary	315
References	315
Bibliography	317
Problems	318

Chapter XI**Growth of Phases: Diffusion or Interface****Reaction Control 319**

Introduction	319
1. Diffusion couple (alpha/beta), no intermediate phase	319
1.1. Components have equal molar volumes	319
1.2. Components have unequal partial molar volumes	321
2. Diffusion couple (alpha/beta) with intermediate phase, incoherent interfaces and at constant molar volume	322
2.1. One intermediate phase	322
2.1.1. Growth of gamma phase under condition that terminal solubilities are very small	323

2.2. Many possible intermediate phases	330
2.3. Amorphous intermediate phase	333
3. Growth involving interface migration	333
3.1. Continuous precipitation	333
3.1.1. Early stage of growth	333
3.1.1.1. Analytic evaluation	333
3.1.1.2. Computer simulations	337
3.1.2. Later stage-Ostwald ripening	340
3.1.3. Coarsening with convection in mushy zone	342
3.2. Diffusion-induced grain boundary migration	344
4. Solidification	346
4.1. Pure materials	346
4.2. Multicomponent systems	347
4.2.1. Local equilibrium at solid-liquid interface	347
4.2.2. Non-equilibrium liquid-solid interface conditions	349
5. Physical vapor deposition	354
6. Chemical vapor deposition	358
7. Sintering	359
8. Summary	361
References	361
Bibliography	363

Chapter XII

Morphological Instability and Growth of Phases 365

Introduction	365
1. Morphological instability	365
1.1. Basis for morphological instability at a reaction front	365
1.2. Liquid-solid interface (solidification)	367
1.3. Vapor-solid interface	372
1.3.1. Chemical vapor deposition	372
1.3.2. Physical vapor deposition	374
1.4. Solid-solid interface	376
2. Dendritic solidification	377
2.1. Pure materials	377
2.2. Multicomponent materials	384
3. Eutectic solidification	387
4. Summary	396
References	397
Bibliography	398

Chapter XIII**Thermodynamics, Kinetics and Patterns 399**

1. Spatial periodic patterns having a thermodynamic origin	399
1.1. Dipole patterns	400
1.2. Modulated surface patterns	404
1.3. Short-range repulsion	405
1.4. Bulk matter	406
2. Spatial periodic patterns far from equilibrium	410
2.1. Dissipative crystals	410
Appendix 1	422
References	423

Chapter XIV**Thermodynamics of Micelles 425**

1. Micelles	425
1.1. Nucleation of micelles	425
2. Characteristics of micelles	430
2.1. Total free energy per unit volume of system	430
2.1.1. Free energy per unit volume of amphiphile solution f	430
2.2. Are micelles phases?	431
2.3. The critical micelle concentration	432
2.4. Contrasting nucleation of heterophases and micelles	435
2.5. What factor(s) control the shape of micelles?	435
2.6. Equilibrium size distribution of micelles and their coexistence	440
3. Vesicles	444
3.1. Bilayer disk to vesicle transition	444
4. Phase equilibria of micellar aggregates	449
References	453
Index	455
