Preface to the second edition *v*

Preface to the first edition *vii*

1 Radiation, physics, and measurement *1*

- 1.1 Introduction *1*
- 1.2 Radioactivity *2*
- 1.3 Types of radiation *3*
- 1.4 Units *4*
- 1.5 The measurement of radiation *6*
 - 1.5.1 Radioactivity *6*
 - 1.5.2 Ionization chamber *6*
 - 1.5.3 Calorimeter *7*
 - 1.5.4 Geiger-Müller and proportional counters *7*
 - 1.5.5 Faraday Cup *8*
 - 1.5.6 The Measurement of radiation by luminescence *8*
 - 1.5.6.1 The Measurement of radiation by luminescence *8*
 - 1.5.6.2 Scintillators *9*
 - 1.5.6.3 Thermoluminescence dosimetry (TLD) *9*
 - 1.5.6.4 Optically-stimulated luminescent phosphors *10*
 - 1.5.6.5 Radiophotoluminescent (RPL) glass *11*
 - 1.5.7 Perspex dosimeters *11*
 - 1.5.8 Colour changes and optical transmission *11*
 - 1.5.9 Fricke dosimeter *12*
 - 1.5.10 Polyethylene and hydrogen pressure *12*
- 1.6 Silicon dosimeters *12*
 - 1.6.1 General *12*
 - 1.6.2 Surface-barrier p+/n/n+ particle detectors, gamma rate monitors *12*
 - 1.6.3 p+/n/n+ diodes as neutron dosimeters *13*
 - 1.6.4 The MOS dosimeter or RADFET *13*

References *15*

2 Radiation environments *17*

- 2.1 The space environment *17*
 - 2.1.1 General *17*
 - 2.1.2 The radiation belts *18*
 - 2.1.3 Cosmic rays *19*
 - 2.1.4 Geomagnetic shielding *25*

2.1.5	Other sources of cosmic rays	25
2.1.6	Solar flares	26
2.1.7	Trapped radiation around other planets	27
2.1.8	SPENVIS—Earth orbit integration	28
2.1.9	New models for trapped radiation	28
2.1.10	Space weather	28
2.1.11	Life science experiments and doses in low orbit	30
2.2	The nuclear reactor environment	31
2.2.1	General	31
2.2.2	Reactor	32
2.2.3	Reactor vessel and cavity	32
2.2.4	Mobile nuclear reactors	33
2.3	The radiation processing environment	34
2.3.1	General	34
2.3.2	Sources and doses	34
2.4	The weapons environment	35
2.4.1	General	35
2.4.2	Radiation output	35
2.4.3	Electromagnetic pulse	37
2.5	The controlled-fusion environment	37
2.6	The environment of robots	38
2.7	High-energy physics accelerators	39
2.8	Terrestrial and man-made environments	43
2.8.1	General	43
2.8.2	Current environmental issues	44
2.8.2.1	Atmospheric radiation—cosmic rays	44
2.8.2.2	Environmental radiation—ground-level sources	45
2.8.2.3	Ingested radiation	46
2.8.2.4	Fallout	46
2.8.2.5	Internal radiation	47
2.8.2.6	The monazite survey project, India	47
2.8.3	The radon hazard	48
2.8.4	Radiation protection	49
2.8.4.1	Regulations	49
2.8.4.2	Risks	50
	References	54

3	The response of materials and devices to radiation	61
3.1	Fundamental damage effects	61
3.2	Atomic displacement	63
3.2.1	The nature of defects in silicon	63
3.2.2	The intrinsic defects	63
3.2.3	Multi-intrinsic defects	64

- 3.2.4 Impurity complexes of the intrinsic defects: the trapped vacancy and trapped interstitial 65
- 3.2.5 Dependence of bulk damage on particle energy and type 69
 - 3.2.5.1 Introduction 69
 - 3.2.5.2 Standard energies for bulk damage equivalence 72
 - 3.2.5.3 Modelling of energy loss in silicon and other crystalline materials—the primary knock-on atom (PKA) 72
 - 3.2.5.4 Formation of the displacement tree 74
 - 3.2.5.5 Time sequences in defect development: the ‘V–V and I–I clouds’ 75
- 3.2.6 Statistics of particle damage 76
- 3.2.7 Degradation of transport in semiconductors 76
 - 3.2.7.1 General 76
 - 3.2.7.2 Minority carriers 76
 - 3.2.7.3 Majority carriers 80
 - 3.2.7.4 Inversion of conductivity type 80
- 3.2.8 Annealing of atomic displacement damage 80
 - 3.2.8.1 Isochronal annealing 80
 - 3.2.8.2 Isothermal annealing 82
 - 3.2.8.3 Stabilization bake for silicon bulk damage 84
 - 3.2.8.4 Reverse annealing 85
- 3.3 Total ionizing dose (TID) effects in devices 85
 - 3.3.1 Ionizing energy deposition and thin films 85
 - 3.3.2 Models for charge trapping in oxides after ionization 86
 - 3.3.3 The charge trap system at the surface of oxidized silicon 88
- 3.4 ‘Colorability’ of transparent materials 91
 - 3.4.1 General 91
 - 3.4.2 The dynamics of colour centres in alkali halide lattices 95
 - 3.4.3 How ‘soft’ are alkali halides and oxides?: units of colorability 97
 - 3.4.4 Colorability tables 97
- 3.5 Induced radioactivity 100
- 3.6 High dose-rate upsets (transient effects) 101
 - 3.6.1 General considerations 101
 - 3.6.2 Bulk semiconductor 103
- 3.7 Transient photocurrents in p-n junctions 104
- 3.8 Single-event phenomena 106
 - 3.8.1 General 106
 - 3.8.2 Single-event upset (SEU) 106
 - 3.8.3 Latch-up 109
- 3.9 Consequences of long-lived degradation 111
- 3.10 Estimating total ionizing dose (TID) or bulk damage (NIEL) 113
- 3.11 Conclusions—an overall view of device response 116

References 116

Further reading 128

- 4 Metal-oxide-semiconductor (MOS) devices 129**
- 4.1 Introduction 129
 - 4.2 Historical 132
 - 4.3 Charge trapping in MOS devices 134
 - 4.3.1 Oxide charge trapping and performance degradation—an overview 134
 - 4.3.2 MOS transistor action and threshold voltage shift 134
 - 4.3.2.1 General 134
 - 4.3.2.2 n-Channel transistor (nMOS) 137
 - 4.3.2.3 Equivalent effects in p-channel devices (pMOS) 137
 - 4.4 Physical model for oxide trapped charge build-up 138
 - 4.4.1 General 138
 - 4.4.2 Interface charge trapping 140
 - 4.4.3 Metal-insulator-semiconductor (MIS) dielectrics 141
 - 4.4.4 Charge collection and trapping processes: the ‘RAD’ model 141
 - 4.4.5 Electrostatics in MOS devices 142
 - 4.4.5.1 Equations 142
 - 4.4.5.2 Thickness and chemistry of the MIS dielectric 142
 - 4.4.6 Dynamics of charge collection and trapping in MIS devices 144
 - 4.4.7 Effect of oxide field and gate bias 145
 - 4.4.7.1 Irradiation bias V_i 145
 - 4.4.7.2 Dependence of R on V_i in MIS devices 146
 - 4.4.7.3 Zero-bias condition ($V_i=0$) oxide charge vs. interface effects 148
 - 4.4.7.4 Intermittent biasing 149
 - 4.4.8 Roll-off, saturation, and turn-over in MIS devices 150
 - 4.4.8.1 Departure from linearity—roll-off and ‘turnaround’ 150
 - 4.4.8.2 MOS technology: a four-lane classification chart 152
 - 4.4.9 ‘Large’ MOS technology and the four-lane chart 155
 - 4.4.10 Submicron MOS technology and the four-lane chart 157
 - 4.4.11 Real MOS devices in the millenium 159
 - 4.4.11.1 General 159
 - 4.4.11.2 The VTNZ effect and its impact 159
 - 4.4.11.3 Field oxide, leakages under 160
 - 4.4.11.4 Effect of interface states on logic operation—rebound 162
 - 4.4.11.5 Noise 162
 - 4.4.11.6 Resistivity change: heavy damage 163
 - 4.5 MIIS systems: the dual dielectric 163
 - 4.5.1 Electrostatics in MIIS devices 163
 - 4.5.2 Charge collection and trapping processes: the ‘RAID’ model 164

- 4.5.3 Experimental data on MIIS devices 165
 - 4.5.3.1 The CCD series 165
 - 4.5.3.2 The CMOS series 167
 - 4.5.3.3 The RADFET series 168
 - 4.5.3.4 Chemistry of MIIS and related complex dielectric structures 169
 - 4.6 Time dependence 169
 - 4.6.1 Annealing and reverse annealing equations 169
 - 4.6.2 High temperature: high recovery rate 171
 - 4.6.3 Room temperature: some recovery 171
 - 4.6.4 Cryogenic temperatures: little recovery 174
 - 4.6.5 'Rebound', 'overshoot', or 'super-recovery' 175
 - 4.6.6 'Reverse annealing' 176
 - 4.6.7 Electron and hole injection: radiation annealing 176
 - 4.6.8 Dose-rate dependence: the problem of enhanced low dose-rate sensitivity (ELDRS) in dielectrics 177
 - 4.6.9 Border-state drift 179
 - 4.7 Transient effects 180
 - 4.7.1 Gamma-ray pulses 180
 - 4.8 Some advanced MOS structures: potential problems 183
 - 4.8.1 Introduction 183
 - 4.8.2 Insulator layers and trenches 184
 - 4.8.3 Lightly and moderately doped drains (LDD and MDD) 185
 - 4.8.4 Non-volatile memories 185
 - 4.8.5 Heavy metals disturb equilibrium 187
 - 4.8.6 CMOS imagers 187
 - 4.8.7 Ferroelectric memories 188
 - 4.8.8 GaAs-on-Si 189
 - 4.8.9 High-voltage and power CMOS ICs 189
 - 4.9 Conclusions 189
 - References 190
 - Further reading 203
- 5 Bipolar transistors and integrated circuits 205**
- 5.1 Introduction 205
 - 5.2 Effects of radiation on device function 205
 - 5.2.1 Gain 205
 - 5.2.2 Degradation of gain 206
 - 5.2.3 Other permanent effects 207
 - 5.2.4 Transient effects 209
 - 5.3 Bulk damage 209
 - 5.3.1 General 209
 - 5.3.2 Influence of base width 211
 - 5.3.3 Influence of type and energy of radiation 213

- 5.3.4 Irradiation results 216
- 5.3.5 Prediction of degradation 221
- 5.3.6 Selection principles for bipolar transistors 221
- 5.4 Surface-linked degradation in gain 222
 - 5.4.1 Introduction 222
 - 5.4.2 Statistical prediction of surface damage 223
 - 5.4.3 Collector-base leakage current 224
 - 5.4.4 The ‘maverick’ device 224
 - 5.4.5 Annealing of surface effects 225
 - 5.4.6 Slow thermal annealing of bulk damage 225
 - 5.4.7 Saturation voltage 226
- 5.5 Long-lived radiation effects in bipolar integrated circuits 227
 - 5.5.1 Digital ICs 228
 - 5.5.2 Emitter-base surface effects in integrated transistors 229
 - 5.5.3 Analogue ICs 231
 - 5.5.4 Lateral p-n-p transistors 232
 - 5.5.5 Isolation technology 233
- 5.6 Enhanced low-dose-rate sensitivity (ELDRS) in junction passivation dielectrics 236
- 5.7 Transient effects in bipolar integrated circuits 238
- 5.8 Summary 240
- References 241
- 6 Diodes, solar cells, and optoelectronics 244**
 - 6.1 Introduction 244
 - 6.2 Changes in diode parameters 245
 - 6.2.1 The I - V curve 245
 - 6.2.2 The capacitance-voltage curve 246
 - 6.2.3 ΔI_F at low currents 246
 - 6.2.4 ΔI_F at high currents 247
 - 6.2.5 Reverse current ΔI_R and damage constant α 247
 - 6.3 Solar cells 248
 - 6.3.1 General 248
 - 6.3.2 Degradation of diffusion length 248
 - 6.3.3 Background 250
 - 6.3.4 Predicting the degradation of solar-cell arrays 251
 - 6.3.5 Equivalence fluences for solar cells 252
 - 6.3.6 Advances in photovoltaics—more tolerance? 254
 - 6.4 Low-power rectifier diodes 256
 - 6.4.1 p-n junctions 256
 - 6.4.2 Schottky-barrier diodes 257
 - 6.5 High-power rectifier diodes 258
 - 6.6 Zener diodes 258
 - 6.7 Microwave diodes 259

- 6.8 Light-detecting devices 259
 - 6.8.1 Photodiodes 259
 - 6.8.2 Detector diodes for high-energy physics 260
 - 6.8.3 Introducing radiation tolerance into p+/n/n+ diodes—
'defect engineering' 263
 - 6.8.4 Wide-base p+/n/n+ diodes—forward voltage drop 264
 - 6.8.5 Spectroscopy and defect movement in highly-doped
diodes 265
 - 6.8.6 Avalanche photodiodes (APD) 266
 - 6.9 Phototransistors 267
 - 6.10 Light-emitting diodes (LEDs) and lasers 267
 - 6.10.1 General 267
 - 6.10.2 LEDs 268
 - 6.10.3 Diode lasers 268
 - 6.11 Optocouplers 270
 - 6.12 Charge-coupled devices (CCDs) 271
 - 6.12.1 General 271
 - 6.12.2 Ionization effects in CCDs: principles 273
 - 6.12.3 Ionization effects in CCDs: test results 274
 - 6.12.4 Bulk damage in CCDs: principles 278
 - 6.12.5 Semiconductor chemistry and defect engineering 280
 - 6.12.6 Principles for recovering from or reducing CTI
growth 280
 - 6.12.7 Dark current from bulk damage 281
 - 6.12.8 Bulk damage effects in CCDs: experiment 282
 - 6.12.9 Transient effects in CCDs 282
 - 6.12.10 In-flight prediction tools for CCDs 282
 - 6.13 Electro-optic crystals 283
 - 6.14 Opto-electronic systems 284
 - 6.15 New computational electronics 284
 - 6.16 Vacuum devices and extreme environments 287
 - 6.17 Conclusions 287
- References 288
-
- 7 Power semiconductors 303
 - 7.1 General 303
 - 7.2 Bipolar power transistors 303
 - 7.3 Thyristors (silicon-controlled rectifiers) 305
 - 7.4 Power MOSFETs 306
 - 7.4.1 Parameter changes under radiation 306
 - 7.4.2 Radiation-tolerant power MOS circuits 307
 - 7.4.3 Transient and heavy-ion-induced burn out 307

- 7.5 Static induction transistor 308
- 7.6 Insulated-Gate Bipolar Transistor (IGBT) 308
- 7.7 Conclusions 309

- 8 Optical media 311**
 - 8.1 General 311
 - 8.2 Window materials and crystals 312
 - 8.2.1 General 312
 - 8.2.2 Alkali halides, oxides, glasses and colour centres 312
 - 8.2.2.1 The coloration and 'fade' of engineering transparencies (inorganic) 312
 - 8.2.2.2 The 'softness' or 'colorability' of transparencies 315
 - 8.2.2.3 Growth and anneal of F-centres 316
 - 8.2.2.4 Oxide transparencies, chalcogenides and diamond 318
 - 8.2.3 Glasses 319
 - 8.2.4 The stability of colour-centres in glass 325
 - 8.3 Coatings 327
 - 8.4 Light guides 327
 - 8.4.1 Introduction 327
 - 8.4.2 Sources of 'colorability' in silica and glasses 327
 - 8.4.3 Prediction models for optical fibre loss versus dose 328
 - 8.4.3.1 Fundamentals 328
 - 8.4.3.2 Simple mathematical model 329
 - 8.4.4 Vapour-deposited fibre technology 331
 - 8.4.5 Fibres drawn from synthetic fused silica rods 333
 - 8.4.6 Fibre luminescence 334
 - 8.4.7 Polymeric optical fibres 334
 - 8.4.8 Neutron-gamma test results on fibres at high-dose values 334
 - 8.5 Scintillators 337
 - 8.5.1 Inorganic crystals and glasses 337
 - 8.5.2 Afterglow—long-lived luminescence after irradiation 338
 - 8.6 Conclusions 340
 - References 341

- 9 Microelectronics, sensors, MEMs, passives, and other components 346**
 - 9.1 Junction field-effect and heterojunction transistors 346
 - 9.1.1 Introduction 346
 - 9.1.2 Mechanisms of degradation of FETs 347
 - 9.1.3 Heterojunction bipolar transistors 347

- 9.2 Transducers 350
 - 9.2.1 General 350
 - 9.2.2 Previous transducer studies 350
- 9.3 Temperature sensors 351
- 9.4 Magnetics 351
- 9.5 Superconductors 354
- 9.6 Mechanical sensors 355
 - 9.6.1 General 355
 - 9.6.2 Microelectromechanical systems (MEMS) 355
- 9.7 Miscellaneous electronic components 356
 - 9.7.1 Capacitors 356
 - 9.7.1.1 Total-dose effects 357
 - 9.7.1.2 Dose-rate effects 357
 - 9.7.2 Resistors and conductors 357
 - 9.7.3 Quartz crystals and ferroelectric memories 358
 - 9.7.4 Vacuum tubes 359
 - 9.7.5 Semiconductor microwave devices 360
 - 9.7.6 Miscellaneous hardware 360
- References 361

10 Polymers and other organics 365

- 10.1 Introduction 365
- 10.2 Radiolytic reactions 366
- 10.3 Radiation tolerance of polymers and organics according to application 368
 - 10.3.1 General 368
 - 10.3.2 Passive polymers in electronics 369
 - 10.3.3 Remote handling 369
 - 10.3.4 Accelerator parts 370
 - 10.3.5 Optical fibres, windows, and scintillators 370
 - 10.3.6 Lubricants 371
 - 10.3.7 Bombardment of coatings in space 371
 - 10.3.8 Thin-film electronics 371
- 10.4 Radiation processing 373
 - 10.4.1 Sterilization of products 373
 - 10.4.2 Irradiation of foods 373
 - 10.4.3 Radiation curing of plastics 374
 - 10.4.4 Resists 374
- 10.5 Long-lived degradation in polymers 374
 - 10.5.1 Relative sensitivity 374
 - 10.5.2 Effects of additives and fillers 375
 - 10.5.3 Combined effects of stress (fields, vacuum, and temperature) and ageing with irradiation 376

- 10.6 Radiation-tolerance of plastics according to technology 376
 - 10.6.1 General 376
 - 10.6.2 Thermoplastics 377
 - 10.6.2.1 Structural plastics 377
 - 10.6.2.2 Plastic films as dielectrics and coatings 377
 - 10.6.3 Thermosetting plastics 378
 - 10.6.4 Elastomers 378
- 10.7 Radiation-induced conductivity and charging in insulators 379
- 10.8 The space environment 381
- 10.9 Conclusion 381
- References 382

- 11 The interaction of radiation with shielding materials 386
 - 11.1 Introduction 386
 - 11.2 Particle radiation transport and range 387
 - 11.2.1 General 387
 - 11.2.2 Range 387
 - 11.3 Transport of electrons 389
 - 11.3.1 Transmission coefficients for electrons 389
 - 11.3.2 Stopping power 391
 - 11.3.3 Internal spectrum 392
 - 11.4 Transport of protons and other heavy particles 394
 - 11.4.1 Interactions 394
 - 11.4.2 Energy loss and attenuation 394
 - 11.5 Electromagnetic radiation: bremsstrahlung, X- and gamma-rays 395
 - 11.5.1 General 395
 - 11.5.2 Bremsstrahlung 395
 - 11.5.3 Gamma rays 397
 - 11.5.4 Other electromagnetic radiation 397
 - 11.5.5 Production and attenuation of electromagnetic radiation 398
 - 11.5.5.1 Production 398
 - 11.5.5.2 Attenuation 400
 - 11.5.5.3 'Build-up' 402
 - 11.5.6 Soft X-rays and vacuum ultraviolet: generation and special effects of long-wavelength X-rays 403
 - 11.5.6.1 Introduction 403
 - 11.5.6.2 Machines and optics 403
 - 11.5.6.3 Absorption constants 404
 - 11.5.6.4 Effects 404
 - 11.6 Radiation attenuation by shielding; deposition of dose in targets 407
 - 11.6.1 Dose versus depth 407
 - 11.6.2 Shielding: relation between space radiation flux and deposited dose 407

- 11.7 Atomic displacement damage versus depth 412
- 11.8 Influence of material type on radiation stopping 413
 - 11.8.1 Deposition of dose 413
 - 11.8.2 Shielding materials 413
- 11.9 Conclusions 416

	Appendix	
A	Useful general and geophysical data	
Table A1	Conversion factors, physical properties, and constants	541
Table A2	Frequency, wavelength, and energy	542
Table A3	Geophysical and orbital parameters and conversion factors	542
B	Radiation quantities	
Table B1	Radiation units and data	543
Table B2	Isotope activity units: traditional and Systeme-International (SI) units of isotope activity	544
Table B3	Energy absorption versus photon energy for air	544
Table B4	Typical performance figures for high-energy radiation sources	545
Table B5	Typical photon energies and wavelengths	546
Table B6	Radioisotopes useful in radiation experiments: main emission energies	547
Table B7	Practical ranges of electrons in aluminium	548
Table B8	Selected values of range of protons in aluminium	549
Table B9	Range of alpha particles in silicon	549
Table B10	Total mass attenuation coefficients of selected materials	550
C	Useful data on materials used in electronic equipment	
Table C1	Densities and chemical formulae of commercial plastics	551
Table C2	Radiation absorption effectiveness of various materials	552
D	Bibliography of dosimeter research	
Table D1	Background references	554
Table D2	RADFET dosimetry	554
Table D3	Neutron diodes and dosimetry for other heavy particles	560

E Dose–depth curves for typical Earth orbits, calculated by ESA’s Space Environment Information System (SPENVIS) software
