

CONTENTS

OF VOLUME I

PART ONE

THE FORMALISM AND ITS INTERPRETATION

CHAPTER I

THE ORIGINS OF THE QUANTUM THEORY

	1. Introduction	3
I.	THE END OF THE CLASSICAL PERIOD	4
	2. Classical Theoretical Physics. 3. Progress in the knowledge of microscopic phenomena and the appearance of quanta in physics.	
II.	LIGHT QUANTA OR PHOTONS	11
	4. The photoelectric effect. 5. The Compton effect. 6. Light quanta and interference phenomena. 7. Conclusions.	
III.	QUANTIZATION OF MATERIAL SYSTEMS	21
	8. Atomic spectroscopy and difficulties of Rutherford's classical model. 9. Quantization of atomic energy levels. 10. Other examples of quantization: space quantization.	
IV.	CORRESPONDENCE PRINCIPLE AND THE OLD QUANTUM THEORY	27
	11. Inadequacy of classical corpuscular theory. 12. Correspondence principle. 13. Application of the correspondence principle to the calculation of the Rydberg constant. 14. Lagrange's and Hamilton's forms of the equations of classical mechanics. 15. Bohr-Sommerfeld quantization rules. 16. Successes and limitations of the Old Quantum Theory. 17. Conclusions.	

CHAPTER II

MATTER WAVES AND THE SCHRÖDINGER EQUATION

	1. Historical survey and general plan of the succeeding chapters	45
I.	MATTER WAVES	49
	2. Introduction. 3. Free wave packet. Phase velocity and group velocity. 4. Wave packet in a slowly varying field. 5. Quantization of atomic energy levels. 6. Diffraction of matter waves. 7. Corpuscular structure of matter. 8. Universal character of the wave-corpuscle duality.	

II.	THE SCHRÖDINGER EQUATION	59
	9. Conservation law of the number of particles of matter.	
	10. Necessity for a wave equation and conditions imposed upon this equation. 11. The operator concept. 12. Wave equation of a free particle. 13. Particle in a scalar potential. 14. Charged particle in an electromagnetic field. 15. General rule for forming the Schrödinger equation by correspondence.	
III.	THE TIME-INDEPENDENT SCHRÖDINGER EQUATION	71
	16. Search for stationary solutions. 17. General properties of the equation. Nature of the energy spectrum.	

CHAPTER III

ONE-DIMENSIONAL QUANTIZED SYSTEMS

	1. Introduction	77
I.	SQUARE POTENTIALS	78
	2. General remarks. 3. Potential step. Reflection and transmission of waves. 4. Infinitely high potential barrier. 5. Infinitely deep square potential well. Discrete spectrum. 6. Study of a finite square well. Resonances. 7. Penetration of a square potential barrier. The "tunnel" effect.	
II.	GENERAL PROPERTIES OF THE ONE-DIMENSIONAL SCHRÖDINGER EQUATION	98
	8. Property of the Wronskian. 9. Asymptotic behavior of the solutions. 10. Nature of the eigenvalue spectrum. 11. Unbound states: reflection and transmission of waves. 12. Number of nodes of bound states. 13. Orthogonality relations. 14. Remark on parity.	

CHAPTER IV

STATISTICAL INTERPRETATION OF THE WAVE-CORPUSCLE DUALITY AND THE UNCERTAINTY RELATIONS

	1. Introduction	115
I.	STATISTICAL INTERPRETATION OF THE WAVE FUNCTIONS OF WAVE MECHANICS	116
	2. Probabilities of the results of measurement of the position and the momentum of a particle. 3. Conservation in time of the norm. 4. Concept of current. 5. Mean values of functions of \mathbf{r} or of \mathbf{p} . 6. Generalization to systems of several particles.	
II.	HEISENBERG'S UNCERTAINTY RELATIONS	129
	7. Position-momentum uncertainty relations of a quantized particle. 8. Precise statement of the position-momentum un-	

	certainty relations. 9. Generalization: uncertainty relations between conjugate variables. 10. Time-energy uncertainty relation. 11. Uncertainty relations for photons.	
III.	UNCERTAINTY RELATIONS AND THE MEASUREMENT PROCESS . . .	139
	12. Uncontrollable disturbance during the operation of measurement. 13. Position measurements. 14. Momentum measurements.	
IV.	DESCRIPTION OF PHENOMENA IN QUANTUM THEORY, COMPLEMENTARITY AND CAUSALITY	149
	15. Problems raised by the statistical interpretation. 16. Description of microscopic phenomena and complementarity. 17. Complementary variables. Compatible variables. 18. Wave-corpuscule duality and complementarity. 19. Complementarity and causality.	

CHAPTER V

DEVELOPMENT OF THE FORMALISM OF WAVE MECHANICS AND ITS INTERPRETATION

	1. Introduction	162
I.	HERMITEAN OPERATORS AND PHYSICAL QUANTITIES	163
	2. Wave-function space. 3. Definition of mean values. 4. Absence of fluctuations and the eigenvalue problem.	
II.	STUDY OF THE DISCRETE SPECTRUM	171
	5. Eigenvalues and eigenfunctions of a Hermitean operator. 6. Expansion of a wave function in a series of orthonormal eigenfunctions. 7. Statistical distribution of the results of measurement of a quantity associated with an operator having a complete set of eigenfunctions with finite norm.	
III.	STATISTICS OF MEASUREMENT IN THE GENERAL CASE	179
	8. Difficulties of the continuous spectrum. Introduction of the Dirac δ -functions. 9. Expansion in a series of eigenfunctions in the general case. Closure relation. 10. Statistical distribution of the results of measurement in the general case. 11. Other ways of treating the continuous spectrum. 12. Comments and examples.	
IV.	DETERMINATION OF THE WAVE FUNCTION	196
	13. Measuring process and "filtering" of the wave packet. Ideal measurements. 14. Commuting observables and compatible variables. 15. Complete sets of commuting observables. 16. Pure states and mixtures.	
V.	COMMUTATOR ALGEBRA AND ITS APPLICATIONS	206
	17. Commutator algebra and properties of basic commutators. 18. Commutation relations of angular momentum. 19. Time dependence of the statistical distribution. Constants of the motion. 20. Examples of constants of the motion. Energy. Parity.	

CHAPTER VI

CLASSICAL APPROXIMATION AND THE WKB METHOD

- | | | |
|-----|--|-----|
| I. | THE CLASSICAL LIMIT OF WAVE MECHANICS | 214 |
| | 1. General remarks. 2. Ehrenfest's theorem. 3. Motion and spreading of wave packets. 4. Classical limit of the Schrödinger equation. 5. Application to Coulomb scattering. The Rutherford formula. | |
| II. | THE WKB METHOD | 231 |
| | 6. Principle of the method. 7. One-dimensional WKB solutions. 8. Conditions for the validity of the WKB approximation. 9. Turning points and connection formulae. 10. Penetration of a potential barrier. 11. Energy levels of a potential well. | |

CHAPTER VII

GENERAL FORMALISM OF THE QUANTUM THEORY

(A) MATHEMATICAL FRAMEWORK

- | | | |
|------|--|-----|
| | 1. Superposition principle and representation of dynamical states by vectors | 243 |
| I. | VECTORS AND OPERATORS | 245 |
| | 2. Vector space. "Ket" vectors. 3. Dual space. "Bra" vectors. 4. Scalar product. 5. Linear operators. 6. Tensor product of two vector spaces. | |
| II. | HERMITEAN OPERATORS, PROJECTORS, AND OBSERVABLES | 254 |
| | 7. Adjoint operators and conjugation relations. 8. Hermitean (or self-adjoint) operators, positive definite Hermitean operators, unitary operators. 9. Eigenvalue problem and observables. 10. Projectors (Projection operators). 11. Projector algebra. 12. Observables possessing an entirely discrete spectrum. 13. Observables in the general case. Generalized closure relation. 14. Functions of an observable. 15. Operators which commute with an observable. Commuting observables. | |
| III. | REPRESENTATION THEORY | 273 |
| | 16. General remarks on finite matrices. 17. Square matrices. 18. Extension to infinite matrices. 19. Representation of vectors and operators by matrices. 20. Matrix transformations. 21. Change of representation. 22. Unitary transformations of operators and vectors. | |

CHAPTER VIII

GENERAL FORMALISM

(B) DESCRIPTION OF PHYSICAL PHENOMENA

1. Introduction	294
I. DYNAMICAL STATES AND PHYSICAL QUANTITIES	296
2. Definition of probabilities. Postulates concerning measurement.	
3. Observables of a quantized system and their commutation relations.	
4. Heisenberg's uncertainty relations.	
5. Definition of the dynamical states and construction of the space \mathcal{E} .	
6. One-dimensional quantum system having a classical analogue.	
7. Construction of the \mathcal{E} -space of a system by tensor product of simpler spaces.	
II. THE EQUATIONS OF MOTION	310
8. Evolution operator and the Schrödinger equation.	
9. Schrödinger "representation".	
10. Heisenberg "representation".	
11. Heisenberg "representation" and correspondence principle.	
12. Constants of the motion.	
13. Equations of motion for the mean values.	
Time-energy uncertainty relation.	
14. Intermediate representations.	
III. VARIOUS REPRESENTATIONS OF THE THEORY	323
15. Definition of a representation.	
16. Wave mechanics.	
17. Momentum representation ($\{p\}$ -representation).	
18. An example: motion of a free wave packet.	
19. Other representations. Representations in which the energy is diagonal.	
IV. QUANTUM STATISTICS	331
20. Incompletely known systems and statistical mixtures.	
21. The density operator.	
22. Evolution in time of a statistical mixture.	
23. Characteristic properties of the density operator.	
24. Pure states.	
25. Classical and quantum statistics.	

PART TWO

SIMPLE SYSTEMS

CHAPTER IX

SOLUTION OF THE SCHRÖDINGER EQUATION BY SEPARATION OF VARIABLES. CENTRAL POTENTIAL

1. Introduction	343
I. PARTICLE IN A CENTRAL POTENTIAL. GENERAL TREATMENT	344
2. Expression of the Hamiltonian in spherical polar coordinates.	

	3. Separation of the angular variables. Spherical harmonics.	
	4. The radial equation. 5. Eigensolutions of the radial equation.	
	Nature of the spectrum. 6. Conclusions.	
II.	CENTRAL SQUARE-WELL POTENTIAL. FREE PARTICLE	355
	7. Spherical Bessel functions. 8. Free particle. Plane waves and free spherical waves. 9. Expansion of a plane wave in spherical harmonics. 10. Study of a spherical square well.	
III.	TWO-BODY PROBLEMS. SEPARATION OF THE CENTER-OF-MASS MOTION	361
	11. Separation of the center-of-mass motion in classical mechanics.	
	12. Separation of the center-of-mass motion of a quantized two- particle system. 13. Extension to systems of more than two particles.	

CHAPTER X

SCATTERING PROBLEMS

CENTRAL POTENTIAL AND PHASE-SHIFT METHOD

	1. Introduction	369
I.	CROSS SECTIONS AND SCATTERING AMPLITUDES	369
	2. Definition of cross sections. 3. Stationary wave of scattering.	
	4. Representation of the scattering phenomenon by a bundle of wave packets. 5. Scattering of a wave packet by a potential.	
	6. Calculation of cross sections. 7. Collision of two particles. Laboratory system and center-of-mass system.	
II.	SCATTERING BY A CENTRAL POTENTIAL. PHASE SHIFTS	385
	8. Decomposition into partial waves. Phase-shift method. 9. Semi- classical representation of the collision. Impact parameters.	
III.	POTENTIAL OF FINITE RANGE	389
	10. Relation between phase shift and logarithmic derivative.	
	11. Behavior of the phase shift at low energies. 12. Partial waves of higher order. Convergence of the series. 13. Scattering by a hard sphere.	
IV.	SCATTERING RESONANCES	396
	14. Scattering by a deep square well. 15. Study of a scattering resonance. Metastable states. 16. Observation of the lifetime of metastable states.	
V.	VARIOUS FORMULAE AND PROPERTIES	404
	17. Integral representations of phase shifts. 18. Dependence upon the potential. Sign of the phase shifts. 19. The Born approximation. 20. Effective range theory. The Bethe formula.	

CHAPTER XI

THE COULOMB INTERACTION

1. Introduction	411
I. THE HYDROGEN ATOM	412
2. Schrödinger equation of the hydrogen atom. 3. Order of magnitude of the binding energy of the ground state. 4. Solution of the Schrödinger equation in spherical coordinates. 5. Energy spectrum. Degeneracy. 6. The eigenfunctions of the bound states.	
II. COULOMB SCATTERING	421
7. The Coulomb scattering wave. 8. The Rutherford formula. 9. Decomposition into partial waves. 10. Expansion of the wave ψ_c in spherical harmonics. 11. Modifications of the Coulomb potential by a short-range interaction.	

CHAPTER XII

THE HARMONIC OSCILLATOR

1. Introduction	432
I. EIGENSTATES AND EIGENVECTORS OF THE HAMILTONIAN	433
2. The eigenvalue problem. 3. Introduction of the operators a, a^\dagger and N . 4. Spectrum and basis of N . 5. The $\{N\}$ representation. 6. Creation and destruction operators. 7. $\{Q\}$ representation. Hermite polynomials.	
II. APPLICATIONS AND VARIOUS PROPERTIES	441
8. Generating function for the eigenfunctions $u_n(Q)$. 9. Intégration of the Heisenberg equations. 10. Classical and quantized oscillator. 11. Motion of the minimum wave packet and classical limit. 12. Harmonic oscillators in thermodynamic equilibrium.	
III. ISOTROPIC HARMONIC OSCILLATORS IN SEVERAL DIMENSIONS	451
13. General treatment of the isotropic oscillator in p dimensions. 14. Two-dimensional isotropic oscillator. 15. Three-dimensional isotropic oscillator.	

APPENDIX A. DISTRIBUTIONS, δ -"FUNCTION" AND FOURIER TRANSFORMATION	462
APPENDIX B. SPECIAL FUNCTIONS AND ASSOCIATED FORMULAE	479
INDEX TO VOLUME I	499
