LIST OF ACRONYMS AND SYMBOLS	xxiii
A FUNDAMENTALS, COMPLEMENTS, AND DEVELOPMENTS: PHYSICS AND MODELING	
1 NEW ASPECTS IN EDFA MODELING	3
1.1 The standard confined-doping (SCD) model CLC / 5	
1.2 Analytical models and their developments in the saturated regime / 11	
1.3 Models for transient gain dynamics with WDM applications in EDFA chains / 61	
1.4 Modeling cladding-pumped Yb^{3+} -sensitized EDFAs / 74	
2 ORIGIN AND ANALYSIS OF NOISE IN EDFAs	89
2.1 Physical origin of the 3 dB noise figure limit / 92	
2.2 Photon-number states and coherent states / 97	

vi CONTENTS

2.3	Fundamental quantum-field-operator model for phase-insensitive coherent light amplification / 111	
2.4	Quantum signal/vacuum-noise beamsplitter model for phase-insensitive coherent light amplification / 122	
2.5	Linear optical amplifier representation through discrete/infinite quantum beamsplitter chains / 131	
2.6	Power and SNR optimization in linear optical amplifier chains / 135	
2.7	Defining the optical amplifier noise figure / 152	
3	INFORMATION CAPACITY OF OPTICALLY AMPLIFIED SIGNALS	170
3.1	Semiclassical signal/vacuum-noise beamsplitter (SCBS) model for phase-insensitive coherent light amplification / 172	
3.2	Accurate semiclassical definition for bit-error-rate and extrapolation methods / 183	
3.3	Entropy and information capacity in optically amplified signals / 201	
3.4	Quantum model for optical amplification and system nonlinearity noises / 232	
4	SECONDARY PHYSICAL EFFECTS IN EDFAs	242
4.1	Concentration/cluster models / 242	
4.2	Resonant refractive-index changes / 256	
4.3	Room-temperature inhomogeneous broadening / 265	
4.4	Polarization hole-burning and polarization-dependent gain / 277	
4.5	Temperature effects / 298	
B	NEW DESIGNS, DEVELOPMENTS, AND SYSTEM APPLICATIONS OF EDFAs	
5	AMPLIFIER TECHNOLOGY AND DESIGN FOR TERRESTRIAL TRANSMISSION	309
5.1	Wavelength-multiplexed transport networks / 310	
5.2	New amplification windows for WDM transport networks / 390	
5.3	EDFAs for CATV systems / 405	
5.4	Metropolitan and access-networks applications / 407	
6	AMPLIFIER TECHNOLOGY AND DESIGN FOR TRANSOCEANIC TRANSMISSION	414
6.1	Amplifier self-filtering effect / 415	

6.2	Operating gain conditions / 425	
6.3	Use of mid-stage isolator / 428	
6.4	Pumping configurations / 432	
6.5	Remotely pumped EDFAs / 440	
6.6	Distributed raman amplification / 442	
6.7	Erbium-doped fiber co-dopants / 449	
6.8	Long-wavelength band operation / 454	
6.9	Gain-equalizing filters / 456	
6.10	Signal pre-emphasis / 458	
6.11	Secondary effects / 460	
7	AMPLIFIED TERRESTRIAL NETWORKS	469
7.1	Fiber bandwidth / 470	
7.2	Transmission fiber types / 472	
7.3	Linear effects in WDM transmission / 477	
7.4	Nonlinear effects in WDM transmission / 484	
7.5	Modulation formats / 527	
7.6	From the origins to massive WDM transmission / 532	
8	AMPLIFIED SUBMARINE-CABLE SYSTEMS	555
8.1	A brief history of submarine-cable systems / 555	
8.2	Global submarine communication networks: from pioneering to information-age times / 558	
8.3	Towards terabit/s systems: the laboratory investigation / 562	
8.4	Topology, features and examples of main submarine cable systems / 606	
APPENDICES		
A	TIME-DEPENDENT AVERAGE-INVERSION MODEL	617
B	DERIVATION OF THE OUTPUT PDF AND ASSOCIATED MEAN AND VARIANCE FOR THE COHERENT SINGLE-PHOTON MULTIPLIER	623
C	SEMICLASSICAL QUANTUM-BEAMSPLITTER MODEL	628
D	SEMICLASSICAL DERIVATION OF SYMBOL PDF AND BER OF OPTICALLY AMPLIFIED SIGNALS	634
E	BER EXTRAPOLATION METHOD BASED ON THE LEVEBERG-MARQUARDT NONLINEAR CURVE-FITTING ALGORITHM	641

F	MUTUAL INFORMATION AND EQUIVOCATION IN DISCRETE MEMORYLESS CHANNEL WITH N-SYMBOL ALPHABET	644
G	SYSTEM PERFORMANCE CRITERIA	647
H	BASIC PRINCIPLES OF ERROR-CORRECTION CODING	650
	REFERENCES	661
	INDEX	755
