

Contents

1	Phase transitions and critical phenomena	1
1.1	Phase and phase diagram	1
1.2	Phase transitions	2
1.3	Critical phenomena	5
1.4	Scale transformation and renormalization group	7
1.5	Ising model and related systems	12
2	Mean-field theories	16
2.1	Mean-field approximation	16
2.2	Critical exponents of the mean-field theory	19
2.3	Landau theory	22
2.4	Landau theory of the tricritical point	27
2.5	Infinite-range model	30
2.6	Variational method	32
2.7	Antiferromagnetic Ising model	34
2.8	Bethe approximation	36
2.9	Correlation function	40
2.10	Limit of applicability of the mean-field approximation	44
2.11	Dynamic critical phenomena	46
3	Renormalization group and scaling	52
3.1	Coarse-graining and scale transformations	52
3.2	Parameter space and renormalization group equation	55
3.3	Renormalization group flow near a fixed point and universality	60
3.4	Scaling law and critical exponents	62
3.5	Scaling law for correlation functions and hyperscaling	65
3.6	A simple example: One-dimensional Ising model	67
3.7	Mean-field theory and scaling law	72
3.8	Scaling dimension and scaling law	73
3.9	Scaling and anomalous dimensions	75
3.10	Data analysis by scaling law and finite-size scaling	76
3.11	Crossover phenomena	79
3.12	Dynamic scaling law	81
4	Implementation of the renormalization group	83
4.1	Real-space renormalization group for arbitrary dimensions	83
4.2	Momentum-space renormalization group: $\epsilon = 4 - d$ expansion	92
4.3	Real-space renormalization group for a quantum system	98

5 Statistical field theory	105		
5.1 From bits to fields	105		
5.2 Continuum limit and field theory	106		
5.3 Hubbard–Stratonovich transformation	109		
5.4 Integrating out degrees of freedom: Coarse graining	111		
5.5 Phenomenological Landau–Ginzburg approach	113		
5.6 Symmetry and its breakdown	116		
5.7 Nambu–Goldstone modes	120		
5.8 Topological defects	123		
6 Conformal field theory	128		
6.1 From scale invariance to conformal symmetry	128		
6.2 Conformal transformation	129		
6.3 Primary and quasi-primary operators	132		
6.4 Energy–momentum tensor and the Ward identity	135		
6.5 Virasoro algebra	139		
6.6 Gaussian theory	140		
6.7 Operator formalism	142		
6.8 Unitary representation of the Virasoro algebra	147		
6.9 Ising model	149		
6.10 Finite-size effects	150		
7 Kosterlitz–Thouless transition	153		
7.1 Peierls argument	153		
7.2 Lower critical dimension of the XY model	155		
7.3 Mermin–Wagner theorem: Absence of spontaneous magnetization	158		
7.4 Kosterlitz–Thouless transition	161		
7.5 Interaction energy of vortex pairs	165		
7.6 Renormalization group analysis	167		
7.7 Lattice gauge theory and Elitzur’s theorem	172		
8 Random systems	178		
8.1 Random fields	178		
8.2 Spin glass	187		
8.3 Diluted ferromagnet and percolation	193		
9 Exact solutions and related topics	204		
9.1 One-dimensional Ising model	204		
9.2 One-dimensional n -vector model	211		
9.3 Spherical model	214		
9.4 One-dimensional quantum XY model	219		
9.5 Two-dimensional Ising model	224		
9.6 Zeros of the partition function	231		
10 Duality	235		
10.1 Classical duality	235		
10.2 High- and low-temperature series expansions	238		
		10.3 Duality by Fourier transformation	244
		10.4 Quantum duality	253
11 Numerical methods	258		
11.1 Master equation	258		
11.2 Monte Carlo simulation	261		
11.3 Numerical transfer matrix method	264		
For further reading	266		
Appendix A	268		
A.1 Saddle-point method	268		
A.2 Expressing the susceptibility in terms of correlation functions	270		
A.3 Rushbrooke’s inequality	272		
A.4 Cumulants	274		
A.5 Renormalization group equations from the ϵ expansion	274		
A.6 Symmetry and Noether’s theorem	284		
A.7 Basics of group theory and Lie algebras	290		
A.8 Basics of homotopy theory	293		
A.9 Restrictions on the type of conformal mappings	294		
A.10 Properties of the energy–momentum tensor	296		
A.11 Energy–momentum tensor of the Gaussian theory	297		
A.12 Existence of spontaneous magnetization in the two-dimensional Ising model	298		
A.13 Quantum version of the Mermin–Wagner theorem	301		
A.14 Replica symmetric solution of the SK model	305		
A.15 Integral for the partition function of the n -vector model	309		
A.16 Multiple Gaussian integral and lattice Green function	310		
A.17 Jordan–Wigner transformation	313		
A.18 Proof of Theorem 9.1	315		
A.19 Poisson summation formula	318		
A.20 Sample codes for Monte Carlo simulation of the Ising model	319		
Appendix B: Solutions to exercises	324		
Index	354
