Preface	xvii
<i>1 Overview</i>	1
<b>1.1 Condensed matter physics</b>	1
<b>1.2 An example - H<sub>2</sub>O</b>	3
1 Gaseous and liquid states	3
2 The liquid-gas phase transition	4
3 Spatial correlations in the liquid state	5
4 Ice – crystallized water	8
5 Broken symmetry and rigidity	10
6 Dislocations – topological defects	12
7 Universality of the water example	13
8 Fluctuations and spatial dimension	15
9 Overview of book	16
<b>1.3 Energies and potentials</b>	17
1 Energy scales	17
2 Van der Waals attraction	18
3 Molecular hydrogen – the Heitler-London approach	20
4 Hard-sphere repulsion	22
5 Exchange interaction and magnetism	24
6 The hydrogen molecule, molecular orbitals, and bands in metals	25
Bibliography	28
References	28
<i>2 Structure and scattering</i>	29
<b>2.1 Elementary scattering theory – Bragg's law</b>	29
<b>2.2 Photons, neutrons, or electrons</b>	33
<b>2.3 The density operator and its correlation functions</b>	34
<b>2.4 Liquids and gases</b>	38
1 Hard-sphere liquids	40
<b>2.5 Crystalline solids</b>	43
1 Unit cells and the direct lattice	43
2 The reciprocal lattice	45

3	Periodic functions	46
4	Bragg scattering	47
2.6	<b>Symmetry and crystal structure</b>	49
1	Two-dimensional Bravais lattices	50
2	Three-dimensional Bravais lattices	53
3	Close packed structures	56
4	Space groups	57
2.7	<b>Liquid crystals</b>	58
1	Isotropic, nematic and cholesteric phases	58
2	Smectics-A and -C	61
3	Hexatic phases	65
4	Discotic phases	68
5	Lyotropic liquid crystals and microemulsions	68
2.8	<b>One- and two-dimensional order in three-dimensional materials</b>	71
2.9	<b>Incommensurate structures</b>	77
2.10	<b>Quasicrystals</b>	82
2.11	<b>Magnetic order</b>	85
2.12	<b>Random isotropic fractals</b>	90
Appendix 2A	<b>Fourier transforms</b>	97
1	One dimension	97
2	$d$ dimensions	99
3	Transforms on a lattice	100
Bibliography		101
References		102
Problems		103
3	<i>Thermodynamics and statistical mechanics</i>	108
3.1	<b>Thermodynamics of homogeneous fluids</b>	108
1	The first law of thermodynamics	109
2	The second law of thermodynamics	111
3	The third law of thermodynamics	111
4	Thermodynamic potentials	112
5	Stability criteria	113
6	Homogeneous functions	115
7	Equations of state	116
3.2	<b>Statistical mechanics: phase space and ensembles</b>	117
3.3	<b>The ideal gas</b>	122
3.4	<b>Spatial correlations in classical systems</b>	123
3.5	<b>Ordered systems</b>	127
3.6	<b>Symmetry, order parameters, and models</b>	132
1	Discrete symmetries	135
2	Continuous symmetries	137

3	Models	139
Appendix 3A	<b>Functional derivatives</b>	140
Bibliography		142
References		142
Problems		142
4	<i>Mean-field theory</i>	144
4.1	<b>Bragg-Williams theory</b>	146
4.2	<b>Landau theory</b>	151
4.3	<b>The Ising and <math>n</math>-vector models</b>	152
1	The nonlocal susceptibility and the correlation length	154
2	$O_n$ symmetry	156
3	Some mean-field transitions	157
4.4	<b>The liquid-gas transition</b>	159
1	The critical point and the critical isochore	162
2	The coexistence curve	165
4.5	<b>The first-order nematic-to-isotropic transition</b>	168
4.6	<b>Multicritical points</b>	172
1	Tricritical points	173
2	Metamagnets and $\text{FeCl}_2$	175
3	$\text{He}^3 - \text{He}^4$ mixtures and the Blume-Emery-Griffiths model	179
4	Bicritical and tetracritical points	181
5	Lifshitz points	184
4.7	<b>The liquid-solid transition</b>	188
1	Are all crystals BCC?	189
2	Criterion for freezing	192
3	Improvements of the theory	192
4	Changes in density	194
5	Density functional theory	195
4.8	<b>Variational mean-field theory</b>	198
1	Two inequalities	198
2	The mean-field approximation	200
3	The $s$ -state Potts model	201
4	The $O_n$ classical Heisenberg model	202
5	Debye-Hückel theory	204
Bibliography		208
References		209
Problems		209
5	<i>Field theories, critical phenomena, and the renormalization group</i>	213
5.1	<b>Breakdown of mean-field theory</b>	214

1	Mean-field transitions revisited	216
<b>5.2</b>	<b>Construction of a field theory</b>	217
1	Coarse graining	217
2	Lattice field theories and their continuum limit	219
3	Gaussian integrals	221
4	Mean-field theory from functional integrals	223
5	Breakdown of mean-field theory revisited	225
<b>5.3</b>	<b>The self-consistent field approximation</b>	226
1	The $n$ -vector model in the limit $n \rightarrow \infty$	229
<b>5.4</b>	<b>Critical exponents, universality, and scaling</b>	230
1	Exponents and scaling relations	230
2	Scaled equation of state	234
3	Multicritical points	235
4	Amplitude ratios	236
5	Theoretical calculations of critical exponents and amplitude ratios	237
<b>5.5</b>	<b>The Kadanoff construction</b>	237
<b>5.6</b>	<b>The one-dimensional Ising model</b>	242
1	Exact solution	242
2	Decimation and renormalization	245
<b>5.7</b>	<b>The Migdal-Kadanoff procedure</b>	248
1	The Ising model on a hypercubic lattice	248
2	General properties of recursion relations	252
3	The Potts lattice gas and krypton on graphite	253
<b>5.8</b>	<b>Momentum shell renormalization group</b>	256
1	Thinning of degrees of freedom and rescaling	256
2	Correlation functions	260
3	The Gaussian model	261
4	The $\epsilon$ -expansion	263
5	$n$ -vector model with cubic anisotropy	267
6	Quadratic anisotropy	269
7	Crossover	270
8	Dangerous irrelevant variables	273
9	The utility of the $\epsilon$ -expansion	275
<b>Appendix 5A</b>	<b>The Hubbard-Stratonovich transformation</b>	276
<b>Appendix 5B</b>	<b>Diagrammatic perturbation theory</b>	277
	Bibliography	283
	References	283
	Problems	283
<b>6</b>	<b>Generalized elasticity</b>	288
<b>6.1</b>	<b>The <math>xy</math>-model</b>	289
1	The elastic free energy	289

2	Boundary conditions and external fields	290
3	The Josephson scaling relation	292
4	Fluctuations	293
5	Long-range order, quasi-long-range order, and disorder	295
6	Resistance of a conducting medium	297
<b>6.2</b>	<b><math>O_n</math> symmetry and nematic liquid crystals</b>	298
1	$n$ -vector elastic energy	298
2	The Frank free energy of nematic liquid crystals	298
3	Cells with non-uniform $\mathbf{n}$	300
4	The Freedericksz transition	302
5	The twisted nematic display	304
6	Fluctuations and light scattering	306
<b>6.3</b>	<b>Smectic liquid crystals</b>	308
1	The elastic free energy	309
2	Fluctuations	312
3	Nonlinearities	314
4	The nematic-to-smectic- $A$ transition	315
<b>6.4</b>	<b>Elasticity of solids: strain and elastic energy</b>	316
1	The strain tensor	316
2	The elastic free energy	318
3	Isotropic and cubic solids	319
4	Fluctuations	321
5	Mercury chain salts – one-dimensional crystals	322
6	Xenon on graphite – a two-dimensional crystal	324
7	Vacancies and interstitials	325
8	Bond-angle order and rotational and translational elasticity	328
9	Elastic constants from density functional theory	329
<b>6.5</b>	<b>Lagrangian elasticity</b>	330
1	Classical theory of elasticity	330
2	Elasticity of classical harmonic lattices	332
<b>6.6</b>	<b>Elasticity of solids: the stress tensor</b>	334
1	The Lagrangian stress tensor	334
2	Stress-strain relations	337
3	The Eulerian stress tensor	338
<b>6.7</b>	<b>The nonlinear sigma model</b>	341
	Bibliography	347
	References	347
	Problems	347
<b>7</b>	<b>Dynamics: correlation and response</b>	353
<b>7.1</b>	<b>Dynamic correlation and response functions</b>	354
1	Correlation functions	354

2	Response functions	355
<b>7.2</b>	<b>The harmonic oscillator</b>	359
1	The undamped oscillator	359
2	The damped oscillator	360
3	The response function	362
4	Dissipation	365
<b>7.3</b>	<b>Elastic waves and phonons</b>	366
1	Sound waves in an elastic continuum	366
2	Acoustic phonons in a harmonic lattice	367
<b>7.4</b>	<b>Diffusion</b>	369
1	Fick's law	369
2	The Green function and dynamic response	370
3	The response function	371
4	External potentials and the Einstein relation	373
5	Brownian motion	375
6	Cooperative diffusion versus self-diffusion	376
7	Master equation for diffusion on a lattice	378
<b>7.5</b>	<b>Langevin theory</b>	381
1	Random forces and thermal equilibrium	381
2	Correlation functions for diffusion	383
3	Short-time behavior	385
4	Fluctuation-dissipation theorem for the harmonic oscillator	387
5	The Fokker-Planck and Smoluchowski equations	388
<b>7.6</b>	<b>Formal properties of response functions</b>	390
1	Response to external fields	390
2	Symmetry properties of response functions	392
3	Dissipation	394
4	Spectral representations of $\chi''_{\phi_i\phi_j}$	395
5	The fluctuation-dissipation theorem	397
6	Sum rules and moment expansions	398
<b>7.7</b>	<b>Inelastic scattering</b>	399
1	Scattering geometry and partial cross-sections	399
2	Fermi golden rule and neutron scattering	400
3	The Fermi pseudopotential	402
4	Coherent and incoherent scattering	404
5	Cross-sections and correlation functions	405
6	Neutron scattering from crystals	406
7	Magnetic scattering	407
8	How neutron scattering experiments are actually done	408
9	Scattering of charged particles and photons	410
	Bibliography	411
	References	411

	Problems	411
<b>8</b>	<b>Hydrodynamics</b>	417
<b>8.1</b>	<b>Conserved and broken-symmetry variables</b>	417
<b>8.2</b>	<b>A tutorial example – rigid rotors on a lattice</b>	419
1	Description of the model	420
2	The disordered phase	421
3	The ordered phase	426
4	Excitations from the classical ground state	430
5	The Goldstone theorem	432
6	Kubo formulae	432
7	Summary	433
<b>8.3</b>	<b>Spin systems</b>	434
1	Spin dynamics	434
2	Generalized Heisenberg models	435
3	The planar magnet	436
4	The isotropic antiferromagnet	438
5	Isotropic ferromagnets	439
<b>8.4</b>	<b>Hydrodynamics of simple fluids</b>	440
1	Conservation laws	441
2	Thermodynamics with mass motion	443
3	The entropy production equation	444
4	Dissipationless hydrodynamics	445
5	Dissipation	446
6	The Navier-Stokes equations	448
7	Hydrodynamic modes	449
8	Light scattering	452
9	Two-component fluids	453
<b>8.5</b>	<b>Liquid crystals, crystalline solids, and superfluid helium</b>	454
1	Nematic liquid crystals	454
2	Smectic-A liquid crystals	456
3	Crystalline solids	459
4	Superfluid helium	460
<b>8.6</b>	<b>Stochastic models and dynamic critical phenomena</b>	464
1	Critical slowing down and the conventional theory	464
2	Dissipative dynamics	466
3	Dynamic scaling	469
4	Poisson bracket terms	472
5	Models with Poisson brackets	475
6	Mode-mode coupling	477
<b>8.7</b>	<b>Nucleation and spinodal decomposition</b>	479
1	Nucleation with a nonconserved order parameter	480
2	Symmetric unstable quench with model A dynamics	483

3 Conserved order parameters and spinodal decomposition	484
Bibliography	491
References	491
Problems	492
<b>9 Topological defects</b>	<b>495</b>
<b>9.1 Characterization of topological defects</b>	<b>495</b>
1 Vortex pairs	499
2 Order parameters with more than two components	499
3 Order parameter spaces and homotopy	501
<b>9.2 Examples of topological defects</b>	<b>506</b>
1 Vortices in $xy$ -models	506
2 Dislocations in smectic liquid crystals	507
3 Periodic solids	512
4 Volterra construction	515
5 Hexagonal and close-packed lattices	515
6 Disclinations in crystals	517
7 Strength of crystals	518
8 Crystal growth	522
9 Grain boundaries	522
10 Nematic and hexatic liquid crystals	524
<b>9.3 Energies of vortices and dislocations</b>	<b>526</b>
1 Simple calculation of $xy$ -vortex energies	526
2 Analogy with magnetism	530
3 Energies of dislocations in crystals	531
4 Dislocations in smectic liquid crystals	536
<b>9.4 Vortex unbinding and the Kosterlitz-Thouless transition</b>	<b>542</b>
1 Vortices and the spin-wave stiffness	542
2 Vortex unbinding in two dimensions – the Kosterlitz-Thouless transition	544
3 Superfluid helium films	551
<b>9.5 Dislocation mediated melting</b>	<b>555</b>
1 Effects of a substrate	558
2 Experiments and numerical simulation	559
<b>9.6 The twist-grain-boundary phase</b>	<b>561</b>
1 Structure of the TGB phase	561
2 The thermodynamic critical field	564
3 The lower critical field	565
4 The upper critical field	566
5 X-ray scattering	568
6 Analogy with superconductivity	571
<b>Appendix 9A Notes on the Kosterlitz-Thouless transition</b>	<b>573</b>

1 Integration of the KT recursion relations	573
2 Longitudinal and transverse response	575
3 The spin correlation function	577
<b>Appendix 9B Duality and the Villain model</b>	<b>578</b>
1 Potts models	579
2 The $xy$ -, Villain, and lattice Coulomb-gas models	582
Bibliography	584
References	584
Problems	585
<b>10 Walls, kinks and solitons</b>	<b>590</b>
<b>10.1 Some simple examples</b>	<b>591</b>
<b>10.2 Domain walls in mean-field theory</b>	<b>595</b>
1 The $\phi^4$ kink	597
2 The sine-Gordon soliton	599
3 Dynamics	599
<b>10.3 The Frenkel-Kontorowa model</b>	<b>601</b>
1 Introduction	601
2 Discommensurations	602
3 Devil's staircases and the FK phase diagram	603
4 The continuum approximation	605
5 Nature of solutions	608
6 The minimum energy solution	610
7 Repulsive interaction between discommensurations	613
8 X-ray diffraction	613
9 Compressional elastic constants	614
10 Phasons	615
11 Pinned phasons	617
12 Extension to two dimensions	618
<b>10.4 Fluctuating walls</b>	<b>620</b>
1 Differential geometry and the total surface area	620
2 Curvature	623
3 Energy of a surface	625
4 Fluctuations in the harmonic approximation	626
5 Nonlinearities and renormalization in fluid-membranes	629
6 Polymerized membranes	630
<b>10.5 Arrays of fluctuating walls</b>	<b>635</b>
1 Fluctuating walls and steric entropy	635
2 Honeycomb lattice of walls	638
3 Elasticity of sterically stabilized phases	638
4 Dislocations and the CI transition	640
<b>10.6 Roughening and faceting</b>	<b>643</b>
1 The solid-on-solid and discrete Gaussian models	643

2	The roughening transition	646
3	Faceting	648
	Bibliography	655
	References	656
	Problems	656
	Glossary	662
	Index	685
