

# Contents

<b>I Some preliminaries</b>	<b>1</b>
<b>1 Studying matter at the atomic and molecular level</b>	<b>3</b>
1.1 Length scales and logarithmic axes	3
1.2 Resolution, magnification and microscopy	6
1.3 Structure, dynamics and spectroscopy	9
1.4 Atomic building blocks and interactions	11
1.4.1 The basic structure of the atom	12
1.4.2 The fundamental forces of nature	13
1.4.3 Probing matter by scattering particles	14
1.5 Energy, length and temperature scales	16
1.6 A table of useful constants	18
<b>2 Waves, complex numbers and Fourier transforms</b>	<b>19</b>
2.1 Sinusoidal waves	19
2.1.1 The direction of propagation	21
2.1.2 The principle of superposition	23
2.2 Complex numbers	25
2.2.1 Definition	25
2.2.2 Basic algebra	26
2.2.3 The Argand diagram	27
2.2.4 The imaginary exponential	27
2.3 Fourier series	29
2.3.1 Orthogonality and the Fourier coefficients	30
2.3.2 The complex Fourier series	32
2.4 Fourier transforms	32
2.4.1 Convolution theorem	34
2.4.2 Auto-correlation function	36
2.5 Fourier optics and physical insight	38
2.5.1 Young's double slit	40
2.5.2 A single wide slit	41
2.5.3 A diffraction grating	42
2.5.4 The convolution theorem in action	43
2.5.5 Multi-dimensional generalization	44
2.6 Fourier data analysis	48
2.6.1 The phase problem	48
2.6.2 Truncation effects and windowing	50
2.6.3 Noise and probability theory	52

2.7 A list of useful formulae	56	5.5 Contrast matching	129
2.7.1 Dimensional analysis	59		
<b>II Elastic scattering</b>	<b>61</b>		
<b>3 The basics of X-ray and neutron scattering</b>	<b>63</b>	<b>6 Liquids and amorphous materials</b>	<b>131</b>
3.1 An idealized scattering experiment	63	6.1 The middle phase of matter	131
3.1.1 Elastic scattering and momentum transfer	64	6.2 Radial distribution functions	132
3.1.2 The differential cross-section	66	6.3 Structure factors	134
3.1.3 Elastic versus total scattering	67	6.3.1 Partial structure factors	137
3.2 Scattering by a single fixed atom	67	6.4 Comparison with small-angle scattering	139
3.2.1 Nuclear scattering lengths	69	6.5 The Placzek correction	139
3.2.2 Atomic form factors	71		
3.2.3 Magnetic form factors	73	<b>7 Periodicity, symmetry and crystallography</b>	<b>141</b>
3.2.4 Scattering cross-sections	75	7.1 Repetitive structures and Bragg peaks	141
3.3 Scattering from an assembly of atoms	77	7.1.1 Atomic planes and Bragg's law	144
3.3.1 Scattering density and Fourier transforms	79	7.1.2 Simple consequences and applications	146
3.3.2 Temperature and Debye–Waller factors	81	7.2 Patterns and symmetries	147
3.3.3 Coherent and incoherent scattering	82	7.2.1 Reality and Friedel pairs	147
3.3.4 Mixed scattering events	84	7.2.2 Centrosymmetry and reality	148
3.4 X-rays and synchrotron sources	84	7.2.3 Space groups and systematic absences	148
3.4.1 Wigglers and undulators	88	7.2.4 Geometry and space groups	150
3.5 Reactors and pulsed neutron sources	89	7.2.5 Symmetry and statistics	151
3.5.1 The time-of-flight technique	91	7.3 Circumventing the phase problem	151
<b>4 Surfaces, interfaces and reflectivity</b>	<b>93</b>	7.3.1 Patterson maps	152
4.1 Reflectivity and Fourier transforms	93	7.3.2 Heavy atoms and partial structure	153
4.1.1 Substrate only	98	7.3.3 Isomorphous replacement	154
4.1.2 One uniform layer	100	7.3.4 Direct methods and prior knowledge	155
4.1.3 A short multilayer	101	7.4 Powdered samples	156
4.1.4 A phaseless Fourier ambiguity	102	7.4.1 Texture	158
4.2 Reflectivity and geometrical optics	104	7.4.2 Twinning	159
4.2.1 Refractive index	105	7.4.3 Fibre diffraction	160
4.2.2 A single boundary	105	7.5 Magnetic structures	160
4.2.3 Multiple boundaries	108		
4.3 X-rays, neutrons and other techniques	110	<b>III Inelastic scattering</b>	<b>163</b>
<b>5 Small-angle scattering and the big picture</b>	<b>113</b>	<b>8 Energy exchange and dynamical information</b>	<b>165</b>
5.1 Diffraction and length scales	113	8.1 Experimental considerations	165
5.2 Size, shape and molecular form factors	114	8.1.1 The partial differential cross-section	166
5.2.1 Absolute intensities	118	8.1.2 Triple-axis spectrometer	167
5.2.2 The Guinier approximation	119	8.1.3 Time-of-flight instruments	168
5.2.3 Porod's law	122	8.2 Scattering from time-varying structures	169
5.2.4 Polydispersity	124	8.2.1 Elastic scattering	170
5.3 Assemblies and correlations	125	8.2.2 Space–time correlation function	170
5.3.1 Orientational alignment	125	8.2.3 Total scattering	171
5.3.2 Positional correlation	126	8.2.4 Coherent and incoherent scattering	172
5.4 Pair-distribution function	127	8.3 A quantum transitions approach	173
		<b>9 Examples of inelastic scattering</b>	<b>175</b>
		9.1 Compton scattering	175
		9.1.1 The impulse approximation	177

9.1.2	Single particle wave function	178
9.2	Lattice vibrations	179
9.2.1	Heat capacities	182
9.2.2	Spin waves	183
9.3	Molecular spectroscopy	184
9.3.1	Quasi-elastic scattering	185
9.3.2	Energy resolution and time-scales	186
<b>A Discrete Fourier transforms</b>		<b>187</b>
<b>B Resonant scattering and absorption</b>		<b>191</b>
