

CONTENTS

PREFACE	xi
-------------------	----

I. BASICS OF PULSE AND FOURIER TRANSFORM NMR

A. Introduction	1
B. The rotating frame.	14
C. Pulse NMR.	20
1. Introduction to pulse NMR	21
2. Pulse NMR experiments.	25
D. Introduction to Fourier transform NMR.	35
1. The driven vs. the pulsed simple harmonic oscillator: An introduction to Fourier transform pairs.	36
2. The nature of Fourier transform NMR	38
3. Comparison of FT and cw NMR	44

II. DETAILS OF PULSE AND FOURIER TRANSFORM NMR

A. Fundamentals	47
1. Some useful Fourier transform theorems	47
2. Pulse length, tip angle, and all that (or just what is the rf pulse doing to the magnetization?)	50
3. Quadrature detection	60
B. The mechanics of FT NMR.	77
1. Digitizing rate and the size of the transform	77
2. Dynamic range and digitizer resolution.	79
3. Positioning the carrier.	81
4. Phase correction.	84
5. Digitally massaging the FID	88
6. FT spectroscopy of wide lines	92
C. Decoupling in Solution NMR	98
Decoupling power; noise decoupling; selective and off resonance decoupling; gated decoupling; homonuclear decoupling	

D.	Special topics	106
1.	Pulse response in the presence of quadrupole splitting	106
2.	Selective excitation	112
3.	2-D spectroscopy	117
4.	CPMG J-spectra	121
5.	Echoes in liquids	123
III. RELAXATION		
A.	General remarks	125
	What is spin-lattice relaxation?; How does spin-lattice relaxation take place?; Other kinds of nuclear relaxation; The spectral density; Additional observations	
B.	Spin-spin relaxation	136
C.	Spin-lattice relaxation	139
1.	Spin-lattice relaxation mechanisms	139
2.	How to differentiate between mechanisms	151
3.	Relaxation of quadrupolar nuclei	156
4.	Oxygen removal from samples	161
D.	Measurement of spin-lattice relaxation	164
1.	Strategies	165
2.	Some typical pulse sequences for T_1 measurements	168
	Double pulse; steady state sequences; progressive saturation with inversion recovery; saturating comb	
3.	T_1 measurements in high resolution NMR	176
4.	Long T_1 problems	182
5.	Analysis of exponential time constants	185
E.	Molecular diffusion in a field gradient	197
1.	Diffusion in a steady field gradient	198
2.	Pulse field gradient method	202
	Stejskal and Tanner sequence; potential problems with pulsed gradient method; Lowe and Karlicek method; stimulated echo method; restricted diffusion	
3.	Gradient calibration	210
IV. NMR OF SOLIDS		
A.	Lineshapes in solids	217
1.	Homogeneous and inhomogeneous lines	218
2.	Moments of absorption lines	227

B.	Dipolar and Zeeman order	241
1.	The meaning of dipolar and Zeeman order	241
2.	Rotating frame adiabatic demagnetization	246
3.	The solid echo and other two pulse echoes	251
4.	The Jeener echo	256
C.	Rotating frame relaxation	261
1.	Rotating frame spin-lattice relaxation measurements	262
2.	The strong and weak collision regimes	266
D.	Spin temperature	270
E.	High resolution NMR of solids	275
1.	Magic angle spinning (MAS)	279
2.	High power decoupling	283
3.	Cross polarization (CP) experiments	284
	How to cool the protons; how to make thermal contact: the Hartmann-Hahn condition; CP experiment: implementation	
4.	Multiple pulse line-narrowing in solids	292
V. NMR HARDWARE		
A.	Basic spectrometer considerations	297
1.	Pulse NMR spectrometers	297
2.	Magnets	312
3.	Transient data acquisition system	318
4.	Recovery times in pulse NMR	325
5.	Time-share modulation	331
B.	Purchasing a spectrometer	335
1.	Basic considerations	335
	Transmitter; pulse sequence and phase capabilities; frequencies; receiver; probe; data system; magnet; miscellaneous; summary	
2.	Desirable features in high resolution spectrometers	350
3.	CP/MAS spectrometers	352
4.	Dealing with instrument companies	354
C.	Spectrometers and components	358
1.	An example of a simple liquids machine	358
2.	An example of a high power machine for solids	361
3.	Use of CAMAC for computer interface	367
4.	Probes	373
	General considerations; construction and tuning; odds and ends; an example	
5.	Probes for superconducting solenoids	386

6.	Crossed diodes and other non-linear elements	388
7.	Single coil duplexers	392
8.	Quarterwave lines and network	400
9.	Tank circuits, impedance matching, and all that	407
10.	Useful packaged components	416
	Double balanced mixer; phase shifter; power divider; directional coupler; magic-tee; quadrature hybrid.	
11.	How to tune a passive circuit and measure its impedance	421
12.	Helpful hardware ideas	422

VI. PRACTICAL TECHNIQUES

A.	Turning it on and tuning it	425
1.	A procedure for tuning up a pulse NMR apparatus	425
	RF signal source: pulse source; probe tuning; transmitter tuning; preamp/receiver tuning; duplexer tuning; fine tuning with an NMR signal; miscellaneous	
2.	How to set the phase of an FID	432
3.	How to set pulse lengths	434
4.	Estimating S/N	437
5.	Searching for resonance in high resolution NMR	440
6.	Searching for a resonance: general considerations	442
7.	Choice of tip angle for optimum S/N	446
8.	When you cannot use lock solvents	449
9.	Helpful hints	450
B.	When things go wrong	452
1.	Troubleshooting suggestions	452
2.	Maintenance equipment suggestions	454
3.	Probe arcing	458
4.	H ₁ inhomogeneity	460
5.	Spurious ringing	463
C.	Noise	468
1.	Removal of coherent noise	468
2.	The analog filter and the FID	474
3.	Digital filtering	479
D.	Special techniques	483
1.	Field cycling	483
2.	High speed spinning of samples	487

3.	Chemical shift concertina	491
4.	Zero time resolution of the FID	493
E.	NMR math	497
1.	Calculational aides in NMR	498
2.	B vs. H	506
3.	What is a dB?	507

POSTSCRIPT	509
----------------------	-----

APPENDICES

A.	References, general and review	513
B.	Review journals in magnetic resonance	515
C.	Conferences in magnetic resonance	517
D.	Hardware sources	521
E.	Abbreviations	527
