Preface			
G	lossary of mathematical symbols	xiii	
1	Introduction: the ways of nature	1	
2	Geometry 2.0 The special and general theories of relativity 2.1 Spacetime as a differentiable manifold 2.2 Tensors 2.3 Extra geometrical structures 2.4 What is the structure of our spacetime?	6 7 15 24 29 41	
	Exercises	44	
3	Classical physics in Galilean and Minkowski spacetimes 3.1 The action principle in Galilean spacetime 3.2 Symmetries and conservation laws 3.3 The Hamiltonian 3.4 Poisson brackets and translation operators 3.5 The action principle in Minkowski spacetime 3.6 Classical electrodynamics Appendix: A note on Galilean transformations Exercises	48 49 53 55 56 59 64 68	
4	General relativity and gravitation 4.1 The principle of equivalence 4.2 Gravitational forces 4.3 The field equations of general relativity 4.4 The gravitational field of a spherical body 4.5 Black and white holes Exercises	<b>71</b> 71 73 75 79 86

## Contents

5.0   Wave mechanics   96   10.1   Ergoalic theory and the microcanonical ensemble   215	5	Quantum theory	95	10	Equilibrium statistical mechanics	213
5.1 The Hilbert space of state vectors			96		10.1 Ergodic theory and the microcanonical ensemble	214
5.2 Operators and observable quantities			99	Ä	10.2 The canonical ensemble	219
5.3   Spacetime translations and properties of operators   108   thermodynamics   225   5.5   An example: the one-dimensional harmonic oscillator   110   10.5   Quantum statistical mechanics   225   5.5   An example: the one-dimensional harmonic oscillator   110   10.5   Quantum statistical mechanics   225   5.5   An example: the one-dimensional harmonic oscillator   110   10.6   Electroless   10.6   Fleid theories at finite temperature   237   5.5   Second quantization and quantum field theory   117   118   10.8   The classical lattice gas   237   6.1   The occupation number representation   118   Exercises   246   6.2   Field operators and observables   121   125   125   125   125   6.3   Equation of motion and Lagrangian formalism for   125   125   125   125   125   125   6.4   Second quantization for fermions   125   126   127   127   127   127   127   6.4   Second quantization for fermions   125   126   127   127   127   127   127   6.5   Relativistic wave equations and field theories   128   128   129   120   120   120   7.1   The Klein-Gordon equation   129   120   120   120   120   120   7.2   Scalar field theory for free particles   131   127   127   127   127   127   127   7.3   The Dirac equation and spin-1 particles   132   127   127   127   127   127   127   127   7.5   Wave equantions in curved spacetime   147   127   127   127   127   127   127   127   127   127   7.5   Wave equantions in curved spacetime   147   128   128   129   120   127					10.3 The grand canonical ensemble	223
5.4   Quantization of a classical system   108   thermodynamics   222						
5.5 An example: the one-dimensional harmonic oscillator   110   10.5   Countum statistical mechanics   22					thermodynamics	223
Exercises						229
10.7   Black-body radiation   233					10.6 Field theories at finite temperature	232
Second quantization and quantum field theory   117   10.9   Analogies between field theory and statistical mechanics   23   10.9   Analogies between field theory and statistical mechanics   24   25   25   26   27   27   27   27   27   27   27		LACIOIOG		3	<del>-</del>	235
6 Second quantization and quantum field theory         117         10.9         Analogies between field theory and statistical mechanics         23           6.1 The occupation number representation         118         Exercises         24           6.2 Field operators and observables         121         11.1 Bose-Einstein condensation         24           6.4 Second quantization for fermions         123         11.1 Bose-Einstein condensation         24           Exercises         126         11.2 Critical points in fluids and magnets         24           Exercises         11.3 The Ising model and its approximation by a field theory         25           7. Relativistic wave equations and field theories         128         11.5 The Ginzburg-Landau theory smetry breaking         25           7.1 The Klein-Gordon equation         129         11.6 The renormalization group         25           7.2 Scalar field theory for free particles         131         11.7 The Ginzburg-Landau theory of superconductors         26           7.3 The Dirac equation and spin-1 particles         132         Exercises         27           8. Forest connections in curved spacetime         147         11.7 The Ginzburg-Landau theory of superconductors         26           8. Forest, connections and gauge fields         156         12.1 The weak interaction         27           8. Forest, c						237
6.1   The occupation number representation   118   Exercises   24	6					cs 238
6.2 Field operators and observables 6.3 Equation of motion and Lagrangian formalism for field operators 6.4 Second quantization for fermions 125 11.1 Bose–Einstein condensation 24. Exercises 126 11.2 Critical points in fluids and magnets 24. Exercises 127 11.3 The Ising model and its approximation by a field theory approximation by a field theory and its approximation by a field theory approximation and the approximation by a field theory approximation and approximation by a field theory approximation and the field theory approximation and the field theory approximation and the field theory approximation approximation and the field theory approximation approximation and the field theory approximation and the field theory approximation and the forizon problem approximation and approximation and the forizon problem approximation and approximation and the forizon problem approximation and approximation and t					-	
Field operators   123		6.2 Field operators and observables	121			
1.1   Bose-Einstein condensation   24		6.3 Equation of motion and Lagrangian formalism for		11	Phase transitions	24
11.2   11.3   11.2   11.3   11.3   11.3   11.4   11.5		field operators		11		
Relativistic wave equations and field theories   128   11.4   Order, disorder and spontaneous symmetry breaking   25   17.5   The Klein–Gordon equation   129   11.6   The Ginzburg–Landau theory   25   27.2   Scalar field theory for free particles   131   11.7   The Ginzburg–Landau theory of superconductors   26   27.3   The Dirac equation and spin-½ particles   132   Exercises   132   Exercises   145		6.4 Second quantization for fermions				
1.1.4   Order, disorder and spontaneous symmetry breaking   25.7		Exercises	126			
7. Relativistic wave equations and field theories 128 17.1 The Klein–Gordon equation 129 11.6 The renormalization group 257 17.1 The Klein–Gordon equation 129 11.6 The renormalization group 258 17.2 Scalar field theory for free particles 131 11.7 The Ginzburg–Landau theory of superconductors 268 17.3 The Dirac equation and spin-½ particles 132 145 145 157 145 158 169 170 180 180 180 180 180 180 180 180 180 18						
7.1 The Klein–Gordon equation  7.2 Scalar field theory for free particles  7.3 The Dirac equation and spin-½ particles  7.4 Spinor field theory  7.5 Wave equations in curved spacetime  147  Exercises  153  12 Unified theories of the fundamental interactions  12.1 The weak interaction  12.2 The Glashow–Salam–Weinberg model for leptons  274  8.1 Electromagnetism  156  12.3 Physical implications of the model for leptons  28  8.1 Electromagnetism  156  12.3 Physical implications of the model for leptons  28  8.2 Non-Abelian gauge theories  8.3 Non-Abelian theories and electromagnetism  169  8.4 Relevance of non-Abelian theories to physics  8.5 The theory of Kaluza and Klein  171  Exercises  173  174  175  187  188  189  191  189  180  13.1 The Robertson–Walker metric  302  9.1 Asymptotic states and the scattering operator  9.2 Reduction formulae  180  180  180  180  181  183  184  184  185  185  186  187  187  188  189  188  180  187  188  189  180  180  180  180  180  180	7	Polotivistic ways equations and field theories	128			
7.2 Scalar field theory for free particles 7.3 The Dirac equation and spin-½ particles 7.4 Spinor field theory 7.5 Wave equations in curved spacetime 8 Forces, connections and gauge fields 8.1 Electromagnetism 8.2 Non-Abelian gauge theories 8.3 Non-Abelian theories and electromagnetism 8.4 Relevance of non-Abelian theories to physics 8.5 The theory of Kaluza and Klein 8.5 The theory of Kaluza and Klein 8.6 The theory of Kaluza and the scattering operator 9 Interacting relativistic field theories 9 Interacting relativistic field theories 180 131 The garly universe 191 Asymptotic states and the scattering operator 9 Path integrals 9 Path integrals 9 Path integrals 9 Quantization of gauge fields 183 13. The fairly early universe 184 20. Scalar field theory of Superconductors 195 20. Scalar field theory of Superconductors 196 21. Colour and quantum chromodynamics 197 22. The Glashow-Salam-Weinberg model for leptons 198 28. Scalar field theories 199 12. Hadronic particles in the electroweak theory 199 12. Grand unified theories 190 12. Grand unified theories 190 12. Grand unified theories 191 12. Gravity and supersymmetry 190 12. Gravity and supersymmetry 190 12. Gravity and supersymmetry 190 12. Exercises 190 12. The Rearly universe 190 12. The Robertson-Walker metric 190 13. The Robertson-Walker metric 190 13. The Friedmann-Lemaître models 190 13. Matter, radiation and the age of the universe 191 13. The fairly early universe 192 13. Recombination and the horizon problem 193 29. Quantization of gauge fields 192 13. Recombination and the horizon problem 194 13. The faitness problem 195 13. The faitness problem 196 13. The flatness problem 197 13. The faitness problem 197 13. The faitness problem 198 13. The very early universe 199 190 190 190 190 190 190 190 190 190	,					
7.3 The Dirac equation and spin-½ particles 132 Exercises 27. 7.4 Spinor field theory 145 7.5 Wave equations in curved spacetime 147 Exercises 153 12 Unified theories of the fundamental interactions 27. Exercises 153 12.1 The weak interaction 27.  8 Forces, connections and gauge fields 156 12.2 Physical implications of the model for leptons 28. 8.1 Electromagnetism 156 12.4 Hadronic particles in the electroweak theory 28. 8.2 Non-Abelian gauge theories 162 12.5 Colour and quantum chromodynamics 28. 8.3 Non-Abelian theories and electromagnetism 169 12.6 Grand unified theories 29. 8.4 Relevance of non-Abelian theories to physics 170 12.7 Gravity and supersymmetry 29. 8.5 The theory of Kaluza and Klein 171 Exercises 29. 8.5 The theory of Kaluza and Klein 171 Exercises 29. 9 Interacting relativistic field theories 176 13.1 The Robertson-Walker metric 30. 9.1 Asymptotic states and the scattering operator 177 13.2 The Friedmann-Lemaître models 30. 9.1 Asymptotic states and the scattering operator 177 13.2 The Friedmann-Lemaître models 30. 9.2 Reduction formulae 180 13.3 Matter, radiation and the age of the universe 31. 9.4 Perturbation theory 188 13.5 Nucleosynthesis 32. 9.5 Quantization of gauge fields 192 13.6 Recombination and the horizon problem 32. 9.6 Renormalization 196 13.7 The flatness problem 32. 9.7 Quantized theories 201 13.8 The very early universe 32.						
7.4 Spinor field theory 7.5 Wave equations in curved spacetime 147 Exercises 153 12 Unified theories of the fundamental interactions 273 12.1 The weak interaction 274 12.2 The Glashow-Salam-Weinberg model for leptons 275 8 Forces, connections and gauge fields 156 12.3 Physical implications of the model for leptons 288.1 Electromagnetism 156 12.4 Hadronic particles in the electroweak theory 288.2 Non-Abelian gauge theories 162 12.5 Colour and quantum chromodynamics 287 28.3 Non-Abelian theories and electromagnetism 169 12.6 Grand unified theories 290 28.5 The theory of Kaluza and Klein 171 Exercises 173 174 175 176 18.1 The early universe 180 9 Interacting relativistic field theories 176 18.1 The Robertson-Walker metric 300 9.1 Asymptotic states and the scattering operator 177 18.2 The Friedmann-Lemaître models 301 9.3 Path integrals 183 184 185 185 186 186 187 187 188 187 188 189 189 189 189 189 189 189 180 180 180 180 180 180 180 180 180 180						
7.5   Wave equations in curved spacetime   147   Exercises   153   12   Unified theories of the fundamental interactions   273   12.1   The weak interaction   274   12.2   The Glashow—Salam—Weinberg model for leptons   275   12.2   The Glashow—Salam—Weinberg model for leptons   275   12.2   The Glashow—Salam—Weinberg model for leptons   276   12.2   Physical implications of the model for leptons   286   28.1   Electromagnetism   156   12.4   Hadronic particles in the electroweak theory   288   28.2   Non-Abelian theories and electromagnetism   169   12.5   Colour and quantum chromodynamics   287   288   Relevance of non-Abelian theories to physics   170   12.7   Gravity and supersymmetry   296   288   Relevance of non-Abelian theories to physics   173   Exercises   173   The early universe   301   291   292   293   294					Exercises	21.
Exercises   153   12   Unified theories of the fundamental interaction   277   12.1   The weak interaction   278   12.1   The weak interaction   278   12.2   The Glashow–Salam–Weinberg model for leptons   278   279
