Preface	ix
Introduction. The uses of lithium hydride, deuteride, and tritide and their solutions with lithium in the new technology	xi

Chapter 1. Physical properties of lithium hydride and of its isotopic modifications

1. Structure of the crystal lattice	1
2. Potential energy of lithium hydride	2
3. Heats of formation and binding energies	5
4. The melting points of lithium hydride, lithium deuteride, and lithium tritide	10

Chapter 2. Thermodynamic properties of the isotopic modifications of lithium hydride in the condensed state

1. Caloric properties	13
1.1. Review and analysis of experimental studies of caloric properties	13
1.2. Analysis of experimental data on the caloric properties of lithium hydride and lithium deuteride	23
1.3. Calculation of the caloric functions of the isotopic modifications of solid-state lithium hydride	28
1.4. Determination of the caloric properties of lithium deuteride and lithium tritide in the liquid phase	39
2. Thermal properties	43
2.1. Review and analysis of experimental studies of the thermal properties-the lattice constant, density, and thermal expansion-in the solid phase	43
2.2. Determination of the thermal properties of lithium hydride and of its solid-phase isotopic modifications: Theory and calculation	51

2.3. Elastic properties of crystalline lithium hydride and of its isotopic modifications	58
2.4. The densities of lithium hydride, lithium deuteride, and lithium tritide in the liquid phase	68
2.5. The surface tension of lithium hydride	77

Chapter 3. Thermodynamic properties of **Li-LiH (LiD, LiT)** systems

1. The phase diagram of the Li-LiH system: Eutectic and monotectic properties	81
2. Thermodynamic properties of Li-LiH (LiD, LiT) systems when the liquid phase is in equilibrium with the vapor	87
2.1. A review of the data in the literature on the pressures of the dissociation products when the Li-LiH (LiD, LiT) systems are in phase equilibrium	87
2.2. The procedure for calculating the activities of the components and other thermodynamic characteristics of Li-LiH solutions from plots of the partial pressure of hydrogen versus composition of the liquid phase	113
2.3. Determination of the activity coefficients, the functions $C(T)$ and $H(T)$, and the equilibrium constant for the reaction $\text{LiH}_l \rightleftharpoons \text{Li}_l + \frac{1}{2}\text{H}_{2\text{gas}}$	120
2.4. Component partial pressures, total pressures, and vapor compositions of the Li-LiH (LiD, LiT) systems when the liquid phase is in equilibrium with the vapor phase	126
2.5. Excess caloric functions in the Li-LiH system	128
3. Thermodynamic features of Li-LiH systems when the liquid phase is in equilibrium with the vapor phase	130
3.1. Behavior of the isotherm on a P-x diagram in the immiscibility zone. Maxwell's rule	131
3.2. Thermodynamic features in the homogeneous region. Azeotropy	133

Chapter 4. Transport properties

1. Thermal conductivity of lithium hydride in the condensed phase	143
1.1. Thermal conductivity of solid lithium hydride	143
1.2. Thermal conductivity of liquid lithium hydride	147
2. Viscosity of liquid lithium hydride	148

3. Electrical conductivity of lithium hydride and lithium deuteride	150
4. The kinetic coefficients of Li-LiH (LiD, LiT) systems in the vapor phase	154
4.1. Review of the experimental and theoretical situations	154
4.2. Interaction potentials of the atomic particles in lithium-hydrogen gas mixtures	155
4.3. Calculation methods for the atomic-particle collision integrals in lithium-hydrogen gas mixtures	161
4.4. The procedure used for calculating the transport coefficients in a lithium-hydrogen (deuterium, tritium) gas mixture	168

Chapter 5. Tables of the thermophysical properties of lithium hydride, deuteride, and tritide and their solutions with lithium

Tables 5.1-5.19	173
----------------------------------	------------

Appendix. Calculation of the temperature dependence of the adiabatic elastic moduli	201
References	205
