

List of Topics

Chapter 1 Introduction to Cells

Cells Under the Microscope	1	Living Cells All Have a Similar Basic Chemistry	21
The Invention of the Light Microscope Led to the Discovery of Cells	2	All Present-Day Cells Have Apparently Evolved from the Same Ancestor	21
Cells, Organelles, and Even Molecules Can Be Seen Under the Microscope	3	Bacteria Are the Smallest and Simplest Cells	22
The Eucaryotic Cell	9	Molecular Biologists Have Focused on <i>E. coli</i>	25
The Nucleus Is the Information Store of the Cell	9	<i>Giardia</i> May Represent an Intermediate Stage in the Evolution of Eucaryotic Cells	25
Mitochondria Generate Energy from Food to Power the Cell	10	Brewer's Yeast Is a Simple Eucaryotic Cell	26
Chloroplasts Capture Energy from Sunlight	12	Single-celled Organisms Can Be Large, Complex, and Fierce: The Protozoans	27
Internal Membranes Create Intracellular Compartments with Different Functions	13	<i>Arabidopsis</i> Has Been Chosen Out of 300,000 Species as a Model Plant	28
The Cytosol Is a Concentrated Aqueous Gel of Large and Small Molecules	15	The World of Animals Is Represented by a Fly, a Worm, a Mouse, and <i>Homo Sapiens</i>	29
The Cytoskeleton Is Responsible for Cell Movements	16	Cells in the Same Multicellular Organism Can Be Spectacularly Different	31
Unity and Diversity of Cells	17	Essential Concepts	34
Cells Vary Enormously in Appearance and Function	19	Questions	35

Chapter 2 Chemical Components of Cells

Chemical Bonds	37	Cells Contain Four Major Families of Small Organic Molecules	52
Cells Are Made of Relatively Few Types of Atoms	38	Sugars Are Energy Sources for Cells and Subunits of Polysaccharides	53
The Outermost Electrons Determine How Atoms Interact	39	Fatty Acids Are Components of Cell Membranes	55
Ionic Bonds Form by the Gain and Loss of Electrons	42	Amino Acids Are the Subunits of Proteins	60
Covalent Bonds Form by the Sharing of Electrons	43	Nucleotides Are the Subunits of DNA and RNA	61
There Are Different Types of Covalent Bonds	45	Macromolecules Contain a Specific Sequence of Subunits	65
Water Is the Most Abundant Substance in Cells	48	Noncovalent Bonds Specify the Precise Shape of a Macromolecule	69
Some Polar Molecules Form Acids and Bases in Water	49	Noncovalent Bonds Allow a Macromolecule to Bind Other Selected Molecules	72
Molecules in Cells	52	Essential Concepts	73
A Cell Is Formed from Carbon Compounds	52	Questions	74

Chapter 3 Energy, Catalysis, and Biosynthesis

Catalysis and the Use of Energy by Cells	79	Activated Carrier Molecules and Biosynthesis	94
Biological Order Is Made Possible by the Release of Heat Energy from Cells	79	The Formation of an Activated Carrier Is Coupled to an Energetically Favorable Reaction	95
Photosynthetic Organisms Use Sunlight to Synthesize Organic Molecules	82	ATP Is the Most Widely Used Activated Carrier Molecule	96
Cells Obtain Energy by the Oxidation of Biological Molecules	83	Energy Stored in ATP Is Often Harnessed to Join Two Molecules Together	97
Oxidation and Reduction Involve Electron Transfers	84	NADH and NADPH Are Important Electron Carriers	98
Enzymes Lower the Barriers That Block Chemical Reactions	85	There Are Many Other Activated Carrier Molecules in Cells	100
How Enzymes Find Their Substrates: The Importance of Rapid Diffusion	86	The Synthesis of Biological Polymers Requires an Energy Input	103
The Free-Energy Change for a Reaction Determines Whether It Can Occur	89	Essential Concepts	105
The Concentration of Reactants Influences ΔG For Sequential Reactions, ΔG° Values Are Additive	85	Questions	106
	93		

Chapter 4 How Cells Obtain Energy from Food

The Breakdown of Sugars and Fats	108	Electron Transport Drives the Synthesis of the Majority of the ATP in Most Cells	124
Food Molecules Are Broken Down in Three Stages to Produce ATP	108	Storing and Utilizing Food	125
Glycolysis Is a Central ATP-producing Pathway	110	Organisms Store Food Molecules in Special Reservoirs	125
Fermentations Allow ATP to Be Produced in the Absence of Oxygen	114	Many Biosynthetic Pathways Begin with Glycolysis or the Citric Acid Cycle	127
Glycolysis Illustrates How Enzymes Couple Oxidation to Energy Storage	114	Metabolism Is Organized and Regulated	128
Sugars and Fats Are Both Degraded to Acetyl CoA in Mitochondria	118	Essential Concepts	129
The Citric Acid Cycle Generates NADH by Oxidizing Acetyl Groups to CO ₂	119	Questions	130

Chapter 5 Protein Structure and Function

The Shape and Structure of Proteins	134	The α Helix and the β Sheet Are Common Folding Patterns	141
The Shape of a Protein Is Specified by Its Amino Acid Sequence	134	Proteins Have Several Levels of Organization	145
Proteins Fold into a Conformation of Lowest Energy	139	Few of the Many Possible Polypeptide Chains Will Be Useful	147
Proteins Come in a Wide Variety of Complicated Shapes	140	Proteins Can Be Classified into Families	147
		Larger Protein Molecules Often Contain More Than One Polypeptide Chain	148

Proteins Can Assemble into Filaments, Sheets, or Spheres	149	V_{\max} and K_M Measure Enzyme Performance	169
A Helix Is a Common Structural Motif in Biological Structures	152	Tightly Bound Small Molecules Add Extra Functions to Proteins	171
Some Types of Proteins Have Elongated Fibrous Shapes	152	The Catalytic Activities of Enzymes Are Regulated	172
Extracellular Proteins Are Often Stabilized by Covalent Cross-Linkages	154	Allosteric Enzymes Have Two Binding Sites That Interact	173
How Proteins Work	154	A Conformational Change Can Be Driven by Protein Phosphorylation	174
Proteins Bind to Other Molecules	155	GTP-binding Proteins Can Undergo Dramatic Conformational Changes	176
The Binding Sites of Antibodies Are Especially Versatile	156	Motor Proteins Produce Large Movements in Cells	176
Binding Strength Is Measured by the Equilibrium Constant	157	Proteins Often Form Large Complexes That Function as Protein Machines	178
Enzymes Are Powerful and Highly Specific Catalysts	167	Essential Concepts	179
Lysozyme Illustrates How an Enzyme Works	167	Questions	180

Chapter 6 DNA

The Structure and Function of DNA	184	Proteins at a Replication Fork Cooperate to Form a Replication Machine	196
Genes Are Made of DNA	185	DNA Repair	198
A DNA Molecule Consists of Two Complementary Chains of Nucleotides	185	Changes in DNA Are the Cause of Mutations	198
The Structure of DNA Provides a Mechanism for Heredity	188	A DNA Mismatch Repair System Removes Replication Errors That Escape from the Replication Machine	200
DNA Replication	189	DNA Is Continually Suffering Damage in Cells	201
DNA Synthesis Begins at Replication Origins	190	The Stability of Genes Depends on DNA Repair	202
New DNA Synthesis Occurs at Replication Forks	191	The High Fidelity with Which DNA Is Maintained Means That Closely Related Species Have Proteins with Very Similar Sequences	205
The Replication Fork Is Asymmetrical	193	Essential Concepts	206
DNA Polymerase Is Self-correcting	194	Questions	207
Short Lengths of RNA Act as Primers for DNA Synthesis	194		

Chapter 7 From DNA to Protein

From DNA to RNA	212	Eucaryotic RNAs Undergo Processing in the Nucleus	218
Portions of DNA Sequence Are Transcribed into RNA	212	Eucaryotic Genes Are Interrupted by Noncoding Sequences	219
Transcription Produces RNA Complementary to One Strand of DNA	213	Introns Are Removed by RNA Splicing	220
Several Types of RNA Are Produced in Cells	215	mRNA Molecules Are Eventually Degraded by the Cell	222
Signals in DNA Tell RNA Polymerase Where to Start and Finish	216	The Earliest Cells May Have Had Introns in Their Genes	223

From RNA to Protein	224	Carefully Controlled Protein Breakdown Helps Regulate the Amount of Each Protein in a Cell	232
An mRNA Sequence Is Decoded in Sets of Three Nucleotides	224	There Are Many Steps Between DNA and Protein	234
tRNA Molecules Match Amino Acids to Codons in mRNA	225	RNA and the Origins of Life	234
Specific Enzymes Couple tRNAs to the Correct Amino Acid	227	Simple Biological Molecules Can Form Under Prebiotic Conditions	235
The RNA Message Is Decoded on Ribosomes	227	RNA Can Both Store Information and Catalyze Chemical Reactions	237
Codons in mRNA Signal Where to Start and to Stop Protein Synthesis	230	RNA Is Thought to Predate DNA in Evolution	239
Proteins Are Made on Polyribosomes	232	Essential Concepts	240
		Questions	241

Chapter 8 Chromosomes and Gene Regulation

The Structure of Eucaryotic Chromosomes	246	Repressors Turn Genes Off and Activators Turn Them On	261
Eucaryotic DNA Is Packaged into Chromosomes	246	Initiation of Eucaryotic Gene Transcription Is a Complex Process	263
Chromosomes Exist in Different States Throughout the Life of a Cell	247	Eucaryotic RNA Polymerase Requires General Transcription Factors	266
Specialized DNA Sequences Ensure That Chromosomes Replicate Efficiently	249	Eucaryotic Gene Regulatory Proteins Control Gene Expression from a Distance	265
Nucleosomes Are the Basic Units of Chromatin Structure	250	Packing of Promoter DNA into Nucleosomes Can Affect Initiation of Transcription	266
Chromosomes Have Several Levels of DNA Packing	252	Eucaryotic Genes Are Regulated by Combinations of Proteins	267
Interphase Chromosomes Contain Both Condensed and More Extended Forms of Chromatin	253	The Expression of Different Genes Can Be Coordinated by a Single Protein	268
Position Effects on Gene Expression Reveal Differences in Interphase Chromosome Packing	256	Combinatorial Control Can Create Different Cell Types	269
Interphase Chromosomes Are Organized Within the Nucleus	256	Stable Patterns of Gene Expression Can Be Transmitted to Daughter Cells	271
Gene Regulation	257	The Formation of an Entire Organ Can Be Triggered by a Single Gene Regulatory Protein	273
Cells Regulate the Expression of Their Genes	258	Essential Concepts	274
Transcription Is Controlled by Proteins Binding to Regulatory DNA Sequences	259	Questions	275

Chapter 9 Genetic Variation

Genetic Variation in Bacteria	278	Mutation in Bacteria Can Be Selected by a Change in Environmental Conditions	280
The Rapid Rate of Bacterial Division Means That Mutation Will Occur Over a Short Time Period	279	Bacterial Cells Can Acquire Genes from Other Bacteria	281

Bacterial Genes Can Be Transferred by a Process Called Bacterial Mating	282	The Evolution of Genomes Has Been Accelerated by Transposable Elements	296
Some Bacteria Can Take Up DNA from Their Surroundings	284	Viruses Are Fully Mobile Genetic Elements That Can Escape from Cells	297
Gene Exchange Occurs by Homologous Recombination Between Two DNA Molecules of Similar Nucleotide Sequence	285	Retroviruses Reverse the Normal Flow of Genetic Information	300
Genes Can Be Transferred Between Bacteria by Bacterial Viruses	288	Retroviruses That Have Picked Up Host Genes Can Make Cells Cancerous	302
Transposable Elements Create Genetic Diversity	289	Sexual Reproduction and the Reassortment of Genes	304
Sources of Genetic Change in Eucaryotic Genomes	291	Sexual Reproduction Gives a Competitive Advantage to Organisms in an Unpredictably Variable Environment	304
Random DNA Duplications Create Families of Related Genes	292	Sexual Reproduction Involves Both Diploid and Haploid Cells	305
Genes Encoding New Proteins Can Be Created by the Recombination of Exons	293	Meiosis Generates Haploid Cells from Diploid Cells	306
A Large Part of the DNA of Multicellular Eucaryotes Consists of Repeated, Noncoding Sequences	294	Meiosis Generates Enormous Genetic Variation	307
About 10% of the Human Genome Consists of	295	Essential Concepts	309
Two		Questions	310

Chapter 10 DNA Technology

How DNA Molecules Are Analyzed	315	cDNA Libraries Represent the mRNA Produced by a Particular Tissue	329
Restriction Nucleases Cut DNA Molecules at Specific Sites	315	Hybridization Allows Even Distantly Related Genes to Be Identified	331
Gel Electrophoresis Separates DNA Fragments of Different Sizes	317	The Polymerase Chain Reaction Amplifies Selected DNA Sequences	332
The Nucleotide Sequence of DNA Fragments Can Be Determined	320	DNA Engineering	335
Nucleic Acid Hybridization	320	Completely Novel DNA Molecules Can Be Constructed	335
DNA Hybridization Facilitates the Prenatal	321	Rare Cellular Proteins Can Be Made in Large Amounts Using Cloned DNA	337
<i>In Situ</i> F	323	RNAs Can Be Produced by Transcription <i>in Vitro</i>	338
Seq	324	Mutant Organisms Best Reveal the Function of a Gene	339
DNA C	325	Transgenic Animals Carry Engineered Genes	340
DNA L	326	Essential Concepts	342
Proc	327	Questions	343
Bacterial Plasmids			
Human			

Chapter 11 Membrane Structure

The Lipid Bilayer	348	A Polypeptide Chain Usually Crosses the Bilayer as an a Helix	358
Membrane Lipids Form Bilayers in Water	349	Membrane Proteins Can Be Solubilized in Detergents and Purified	360
The Lipid Bilayer Is a Two-dimensional Fluid	352	The Complete Structure Is Known for Very Few Membrane Proteins	361
The Fluidity of a Lipid Bilayer Depends on Its Composition	353	The Plasma Membrane Is Reinforced by the Cell Cortex	363
The Lipid Bilayer Is Asymmetrical	354	The Cell Surface Is Coated with Carbohydrate	364
Lipid Asymmetry Is Generated Inside the Cell	355	Cells Can Restrict the Movement of Membrane Proteins	366
Lipid Bilayers Are Impermeable to Solutes and Ions	356	Essential Concepts	368
Membrane Proteins	357	Questions	368
Membrane Proteins Associate with the Lipid Bilayer in Various Ways	358		

Chapter 12 Membrane Transport

The Ion Concentrations Inside a Cell Are Very Different from Those Outside	372	Ion Channels Randomly Snap Between Open and Closed States	388
Carrier Proteins and Their Functions	373	Voltage-gated Ion Channels Respond to the Membrane Potential	390
Solutes Cross Membranes by Passive or Active Transport	375	The Membrane Potential Is Governed by Membrane Permeability to Specific Ions	391
Electrical Forces as Well as Concentration Gradients Can Drive Passive Transport	375	Ion Channels and Signaling in Nerve Cells	394
Active Transport Moves Solutes Against Their Electrochemical Gradients	377	Action Potentials Provide for Rapid Long-Distance Communication	395
Animal Cells Use the Energy of ATP Hydrolysis to Pump Out Na ⁺	378	Action Potentials Are Usually Mediated by voltage-gated Na ⁺ Channels	395
The Na ⁺ -K ⁺ Pump Is Driven by the Transient Addition of a Phosphate Group	379	Voltage-gated Ca ²⁺ Channels Convert Electrical Signals into Chemical Signals at Nerve Terminals	397
Animal Cells Use the Na ⁺ Gradient to Take Up Nutrients Actively	380	Transmitter-gated Channels in Target Cells Convert Chemical Signals Back into Electrical Signals	399
The Na ⁺ -K ⁺ Pump Helps Maintain the Osmotic Balance of Animal Cells	381	Neurons Receive Both Excitatory and Inhibitory Inputs	400
Intracellular Ca ²⁺ Concentrations Are Kept Low by Ca ²⁺ Pumps	383	Synaptic Connections Enable You to Think, Act, and Remember	401
H ⁺ Gradients Are Used to Drive Membrane Transport in Plants, Fungi, and Bacteria	384	Essential Concepts	404
Ion Channels and the Membrane Potential	385	Questions	405
Ion Channels Are Ion Selective and Gated	386		

Chapter 13 Energy Generation in Mitochondria and Chloroplasts

Cells Obtain Most of Their Energy by a Membrane-based Mechanism	409	Metals Tightly Bound to Proteins Form Versatile Electron Carriers	425
Mitochondria and Oxidative Phosphorylation	410	Protons Are Pumped Across the Membrane by the Three Respiratory Enzyme Complexes	427
A Mitochondrion Contains Two Membrane-bounded Compartments	411	Respiration Is Amazingly Efficient	429
High-Energy Electrons Are Generated via the Citric Acid Cycle	413	Chloroplasts and Photosynthesis	430
Electrons Are Transferred Along a Chain of Proteins in the Inner Mitochondrial Membrane	414	Chloroplasts Resemble Mitochondria but Have an Extra Compartment	430
Electron Transport Generates a Proton Gradient Across the Membrane	415	Chloroplasts Capture Energy from Sunlight and Use It to Fix Carbon	432
The Proton Gradient Drives ATP Synthesis	417	Excited Chlorophyll Molecules Funnel Energy into a Reaction Center	433
Coupled Transport Across the Inner Mitochondrial Membrane Is Driven by the Electrochemical Proton Gradient	419	Light Energy Drives the Synthesis of ATP and NADPH	434
Proton Gradients Produce Most of the Cell's ATP	419	Carbon Fixation Is Catalyzed by Ribulose Biphosphate Carboxylase	436
The Rapid Conversion of ADP to ATP in Mitochondria Maintains a High ATP : ADP Ratio in Cells	421	Carbon Fixation in Chloroplasts Generates Sucrose and Starch	438
Electron-Transport Chains and Proton Pumping	421	The Genetic Systems of Mitochondria and Chloroplasts Reflect Their Prokaryotic Origin	438
Protons Are Readily Moved by the Transfer of Electrons	422	Our Single-celled Ancestors	439
The Redox Potential Is a Measure of Electron Affinities	422	RNA Sequences Reveal Evolutionary History	439
Electron Transfers Release Large Amounts of Energy	423	Ancient Cells Probably Arose in Hot Environments	440
		<i>Methanococcus</i> Lives in the Dark, Using Only Inorganic Materials as Food	441
		Essential Concepts	443
		Questions	444

Chapter 14 Intracellular Compartments and Transport

Membrane-bounded Organelles	448	Proteins Unfold to Enter Mitochondria and Chloroplasts	457
Eucaryotic Cells Contain a Basic Set of Membrane-bounded Organelles	449	Proteins Enter the Endoplasmic Reticulum While Being Synthesized	458
Membrane-bounded Organelles Evolved in Different Ways	450	Soluble Proteins Are Released into the ER Lumen	459
Protein Sorting	452	Start and Stop Signals Determine the Arrangement of a Transmembrane Protein in the Lipid Bilayer	461
Proteins Are Imported into Organelles by Three Mechanisms	453	Vesicular Transport	462
Signal Sequences Direct Proteins to the Correct Compartment	453	Transport Vesicles Carry Soluble Proteins and Membrane Between Compartments	463
Proteins Enter the Nucleus Through Nuclear Pores	455		

Vesicle Budding Is Driven by the Assembly of a Protein Coat	463	Endocytic Pathways	472
The Specificity of vesicle Docking Depends on SNAREs	465	Specialized Phagocytic Cells Ingest Large Particles	472
Secretory Pathways	467	Fluid and Macromolecules Are Taken Up by Pinocytosis	473
Most Proteins Are Covalently Modified in the ER	467	Receptor-mediated Endocytosis Provides a Specific Route into Animal Cells	474
Exit from the ER Is Controlled to Ensure Protein Quality	468	Endocytosed Macromolecules Are Sorted in Endosomes	475
Proteins Are Further Modified and Sorted in the Golgi Apparatus	469	Lysosomes Are the Principal Sites of Intracellular Digestion	476
Secretory Proteins Are Released from the Cell by Exocytosis	470	Essential Concepts	478
		Questions	479

Chapter 1.5 Cell Communication

General Principles of Cell Signaling	482	Some G Proteins Activate Membrane-bound Enzymes	496
Signals Can Act over Long or Short Range	482	The Cyclic AMP Pathway Can Activate Enzymes and Turn On Genes	497
Each Cell Responds to a Limited Set of Signals	484	The Pathway Through Phospholipase C Results in a Rise in Intracellular Ca ²⁺	499
Receptors Relay Signals via Intracellular Signaling Pathways	486	A Ca ²⁺ Signal Triggers Many Biological Processes	501
Some Signal Molecules Can Cross the Plasma Membrane	488	Intracellular Signaling Cascades Can Achieve Astonishing Speed, Sensitivity, and Adaptability: Photoreceptors in the Eye	502
Nitric Oxide Can Enter Cells to Activate Enzymes Directly	489	Enzyme-linked Receptors	504
There Are Three Main Classes of Cell-Surface Receptors	490	Activated Receptor Tyrosine Kinases Assemble a Complex of Intracellular Signaling Proteins	505
Ion-Channel-linked Receptors Convert Chemical Signals into Electrical Ones	491	Receptor Tyrosine Kinases Activate the GTP-binding Protein Ras	506
Intracellular Signaling Cascades Act as a Series of Molecular Switches	492	Protein Kinase Networks Integrate Information to Control Complex Cell Behaviors	508
G-Protein-linked Receptors	493	Essential Concepts	510
Stimulation of G-Protein-linked Receptors Activates G-Protein Subunits	493	Questions	511
Some G Proteins Regulate Ion Channels	495		

Chapter 16 Cytoskeleton

Intermediate Filaments	514	Microtubules Are Hollow Tubes with Structurally Distinct Ends	519
Intermediate Filaments Are Strong and Durable	515	Microtubules Are Maintained by a Balance of Assembly and Disassembly	519
Intermediate Filaments Strengthen Cells Against Mechanical Stress	516	The Centrosome Is the Major Microtubule-organizing Center in Animal Cells	521
Microtubules	518		

Growing Microtubules Show Dynamic Instability	522
Microtubules Organize the Interior of the Cell	523
Motor Proteins Drive Intracellular Transport	525
Organelles Move Along Microtubules	526
Actin	527
Actin	529
Actin	530
Actin	531
Many Proteins Bind to Actin and Modify Its Properties	532

An Actin-rich Cortex Underlies the Plasma Membrane of Most Eucaryotic Cells	533
Cell Crawling Depends on Actin	533
Actin Associates with Myosin to Form Contractile Structures	536
During Muscle Contraction Actin Filaments Slide Against Myosin Filaments	538
Muscle Contraction Is Triggered by a Sudden Rise in Ca^{2+}	539
Essential Concepts Questions	543
	544

Chapter 17 Cell Division

Overview of the Cell Cycle	549	Cytokinesis	560
The Eucaryotic Cell Cycle Is Divided into Four Phases	549	The Mitotic Spindle Determines the Plane of Cytoplasmic Cleavage	560
The Cytoskeleton Carries Out Both Mitosis and Cytokinesis	551	The Contractile Ring of Animal Cells Is Made of Actin and Myosin	561
Some Organelles Fragment at Mitosis	551	Cytokinesis in Plant Cells Involves New Cell-Wall Formation	562
Mitosis	552	Meiosis	563
The Mitotic Spindle Starts to Assemble in Prophase	552	Homologous Chromosomes Pair Off During Meiosis	563
Chromosomes Attach to the Mitotic Spindle at Prometaphase	553	Meiosis Involves Two Cell Divisions Rather Than One	564
Chromosomes Line Up at the Spindle Equator at Metaphase	557	Essential Concepts Questions	567
Daughter Chromosomes Segregate at Anaphase	557		568
The Nuclear Envelope Re-forms at Telophase	559		

Chapter 18 Cell-Cycle Control and Cell Death

The Cell-Cycle Control System	572	Different Cyclin-Cdk Complexes Trigger Different Steps in the Cell Cycle	578
A Central Control System Triggers the Major Processes of the Cell Cycle	572	The Cell Cycle Can Be Halted in G_1 by Cdk Inhibitor Proteins	580
The Cell-Cycle Control System Is Based on Cyclically Activated Protein Kinases	574	Cells Can Dismantle Their Control System and Withdraw from the Cell Cycle	581
MPF Is the Cyclin-Cdk Complex That Controls Entry into M Phase	575	Control of Cell Numbers in Multicellular Organisms	582
Cyclin-dependent Protein Kinases Are Regulated by the Accumulation and Destruction of Cyclin	576	Cell Proliferation Depends on Signals from Other Cells	582
The Activity of Cdks Is Further Regulated by Their Phosphorylation and Dephosphorylation	578	Animal Cells Have a Built-in Limitation on the Number of Times They Will Divide	584

Animal Cells Require Signals from Other Cells to Avoid Programmed Cell Death	584	Cancer Cells Disobey the Social Controls on Cell Proliferation and Survival	587
Programmed Cell Death Is Mediated by an Intracellular Proteolytic Cascade	585	Essential Concepts	589
		Questions	590

Chapter 19 Tissues

Extracellular Matrix and Connective Tissues	594	Tissue Maintenance and Renewal, and Its Disruption by Cancer	613
Plant Cells Have Tough External Walls	594	Different Tissues Are Renewed at Different Rates	615
Cellulose Fibers Give the Plant Cell Wall Its Tensile Strength	596	Stem Cells Generate a Continuous Supply of Terminally Differentiated Cells	615
Animal Connective Tissues Consist Largely of Extracellular Matrix	600	Mutations in a Single Dividing Cell Can Cause It and Its Progeny to Violate the Normal Controls	618
Collagen Provides Tensile Strength in Animal Connective Tissues	600	Cancer Is a Consequence of Mutation and Natural Selection Within the Population of Cells That Form the Body	619
Cells Organize the Collagen That They Secrete	602	Cancer Requires an Accumulation of Mutations	620
Integrins Couple the Matrix Outside a Cell to the Cytoskeleton Inside It	603	Development	621
Gels of Polysaccharide and Protein Fill Spaces and Resist Compression	604	Programmed Cell Movements Create the Animal Body Plan	622
Epithelial Sheets and Cell-Cell Junctions	605	Cells Switch On Different Sets of Genes According to Their Position and Their History	622
Epithelial Sheets Are Polarized and Rest on a Basal Lamina	606	Diffusible Signals Can Provide Cells with Positional Information	624
Tight Junctions Make an Epithelium Leak-proof and Separate Its Apical and Basal Surfaces	607	Studies in <i>Drosophila</i> Have Given a Key to Vertebrate Development	626
Cytoskeleton-linked Junctions Bind Epithelial Cells Robustly to One Another and to the Basal Lamina	609	Similar Genes Are Used Throughout the Animal Kingdom to Give Cells an Internal Record of Their Position	627
Gap Junctions Allow Ions and Small Molecules to Pass from Cell to Cell	612	Essential Concepts	628
		Questions	629
