Preface to the Russian Edition	ix
Preface to the English Edition	xi
Chapter 1 Hydrooptical characteristics	1
1.1. Optical properties of ocean water	1
1.1.1. Definitions	1
1.1.2. Typical values	7
1.2. Properties of the light field in the ocean	10
1.2.1. Definitions	10
1.2.2. Typical values	16
1.2.3. Absorption coefficient and divergence of the light vector: Get-shun's formula	18
1.3. Depth of visibility of a white disc and the colour of the sea	19
1.3.1. White (Secchi) disc	19
1.3.2. Colour of the sea	22
Chapter 2 Factors determining the optical properties of ocean water	28
2.1. Pure water and dissolved substances	28
2.1.1. Pure water	28
2.1.2. Inorganic salts and gases	29
2.1.3. Organic compounds. Yellow substance	35
2.2. Suspensions	39
2.2.1. Methods of investigation	39
2.2.2. Investigation results: suspended materials in the world's oceans	45
Chapter 3 Molecular optics of ocean water	55
3.1. Optical constants	55
3.2. Optical constants of pure water, pure ocean water and dissolved organic substances	59
3.2.1. Pure water	59
3.2.2. Pure ocean water	66
3.2.3. Dissolved organic substances	70
3.3. Suspended particles	73

3.4. Theory of the molecular scattering of light by ocean water	77
3.4.1. Scattering due to fluctuations in density and temperature	77
3.4.2. The effect of fluctuations in molecule orientation	83
3.4.3. The effect of dissolved substances	85
3.4.4. Fine structure of the molecular scattering of light	87
3.5. Data on the molecular scattering of light by ocean water	90
3.5.1. Empirical formula for the refractive index of light in ocean water	90
3.5.2. Molecular scattering of light by ocean water	95
 Chapter 4 Scattering by suspended particles	 100
4.1. Light scattering by a sphere. Scattering coefficients and the volume scattering function	100
4.1.1. Components of the scattered field. Partial waves	100
4.1.2. Convergence. Two methods of notation	105
4.1.3. Intensity of scattered light. Scattering coefficients and volume scattering function. Characteristics of scattering asymmetry	108
4.2. Polarized light scattering	111
4.2.1. Methods for describing the state of polarization. The Stokes parameters	111
4.2.2. The scattering matrix	114
4.3. Limiting cases for small and large particles	116
4.3.1. Small particles	116
4.3.2. Large particles	119
4.4. 'Soft' particles	125
4.4.1. The Rayleigh-Hans-Debye (RHD) approximation	125
4.4.2. The physical optics approximation	127
4.5. Tabulation of the Mie formulae: tables and their analysis	131
4.6. Scattering of an ensemble of particles	138
4.6.1. Coherent and non-coherent scattering	138
4.6.2. Distribution functions	142
4.6.3. Limiting cases for small and large particles, small angle scattering, soft particles	147
4.6.4. The general case: tables and their analysis	149
 Chapter 5 Optical properties of real ocean water	 155
5.1. Absorption by suspended particles	155
5.1.1. Relationship between the spectrum of the suspension and the spectrum of the particulate material	155
5.1.2. Absorption by phytoplankton cells, terrigenous particles and detritus	160
5.2. Absorption of light by ocean water	165
5.2.1. Overview	165
5.2.2. Variation in the absorption coefficient	173
5.2.3. Relative role of the different components	175

CONTENTS

vii

5.3. Light scattered by ocean water	179
5.3.1. Scattering by non-spherical and inhomogeneous particles	179
5.3.2. General properties of the scattering functions	187
5.3.3. Statistical characteristics and models of the scattering functions	191
5.3.4. Variation in the scattering coefficient	197
5.4. Polarized light scattering	200
5.4.1. Degree of polarization	200
5.4.2. Light scattering matrices for ocean water	202
5.5. Optical characteristics of the waters of the world's oceans	205
5.5.1. Secchi depth field	205
5.5.2. Attenuation coefficient field	206
Chapter 6 Inverse problems	211
6.1. General formulation	211
6.1.1 Ill-posedness, regularization and conditioning	211
6.1.2. Determination of the characteristics of a disperse medium from the scattering of light	215
6.2. The restricted problem	217
6.2.1 Determination of the numerical or mass concentration and other distribution moments	217
6.2.2 The fitting method	220
6.3 The method of fluctuations	224
6.3.1. Basic relationships	224
6.3.2. Experimental verification and accuracy	228
6.4. Method of small angles	232
6.4.1 Initial equation	232
6.4.2. Experimental testing. Essential range of angles	236
6.4.3. Use of actual and integral values of the scattering function. Accuracy of the method	240
6.5. The method of spectral transmittance and the method of the total scattering function	243
6.5.1. Method of spectral transmittance	243
6.5.2. Method of the total scattering function	246
6.6. Numerical inversion methods	250
6.6.1. Regularization in the family of smooth functions	250
6.6.2. Consideration of additional optical information	255
6.7. Determination of the composition of marine suspension	258
6.7.1. Principle of the method	258
6.7.2. Improved version	263
6.7.3. Combined application of the statistical regularization and fluctuation methods	268
