

Contents

Introduction	1
1. The Liouville Equation	13
1. The Phase Space of a Mechanical System	13
2. Representative Ensembles	14
3. The Liouville Equation.	15
4. Formal Solution of the Liouville Equation	19
5. Non-Interacting Particles	22
6. Action-Angle Variables	25
7. Liouville's Theorem in Action-Angle Variables	29
8. Liouville's Equation in Interaction Representation	30
9. Example	33
10. Discussion of the Interaction Representation	33
11. Time-Dependent and Time-Independent Perturbation Theory.	34
2. Anharmonic Solids	36
1. Hamiltonian.	36
2. The Liouville Operator	41
3. Formal Solution for the Energy Distribution Function	43
4. Diagram Technique	46
6. Second-Order Contributions	50
6. Fourth-Order Contributions	56
7. Master Equation.	59
8. H-Theorem	61
9. Fokker-Planck Equation and Master Equation	63
3. Brownian Motion	67
1. Basic Equations	67
2. Approach to Equilibrium	71
3. Statistical Theory of Brownian Motion.	73
4. Evolution of the Fourier Components	79
5. Brownian Motion in Displacement and Velocity	80
6. Comparison with the Phenomenological Theory of Brownian Motion	82
4. Weakly Coupled Gases	86
1. Liouville Operator	86
2. Master Equation for Weakly Coupled Gases-Diagrams	88

3. Boltzmann Equation and Molecular Chaos	90
4. Explicit Form of the Boltzmann Equation	92
5. Brownian Motion	95
6. Fokker-Planck Equation and Dynamical Friction	99
7. Electrostatic Interactions — The Divergence Problem	102
5. Approach to Equilibrium in Weakly Coupled Gases	106
1. Introduction.	106
2. H-Theorem	106
3. Disappearance of Inhomogeneities	108
4. Discussion.	112
6. Scattering Theory and Short-Range Forces	113
1. Two-Body Scattering Theory	113
2. Propagators	119
3. Scattering in Phase Space	121
4. Equilibrium Distribution and Scattering Theory	126
5. <i>N</i> -Body Problem in the Limit of Low Concentrations.	127
6. Master Equation in the Limit of Low Concentrations.	133
7. Scattering Theory and the <i>N</i> -Body Problem	136
7. Distribution Functions: The Diagram Representation	138
1. Distribution Functions	138
2. Fourier Expansion and Distribution Functions	142
3. Singularities in the Fourier Expansion.	145
4. Cluster Expansion of the Distribution Functions	147
5. Physical Meaning of the Fourier Coefficients	150
6. Diagrams	152
7. Concentration Dependence of Diagrams	158
8. Reduced Distribution Functions and Diagrams	161
8. The Time Dependence of Diagrams	164
1. Effect of H_0 —Wave Packets	164
2. Duration of a Collision.	166
3. Resolvent Method	169
4. Analytic Behavior of the Resolvent	172
5. Diagonal Fragments	176
6. Free Propagation and Scattering	178
7. Destruction of Correlations	181
8. Creation of Correlations	183
9. Propagation of Correlations.	185
10. General Remarks about the Time Dependence of Diagrams	187

11. Velocity Distribution in Weakly Coupled or Dilute Systems	190
12. The Thermodynamic Case	193
13. Dynamics of Correlations and Time Dependence	195
9. Approach to Equilibrium in Ionized Gases	196
1. Choice of Diagrams	196
2. Summation of Rings	202
3. Solution of the Integral Equation	204
4. Discussion of the Transport Equation	208
10. Statistical Hydrodynamics	211
1. Introduction.	211
2. Transport Equation in the Limit of Large Free Paths	214
3. Factorization Theorems for Fourier Coefficients.	217
4. Time Scales and Diagrams	218
5. Transport Equation in the Hydrodynamic Case—the Boltzmann Equation	222
6. Discussion of the Approach to Equilibrium in Inhomogeneous Systems.	223
11. General Kinetic Equations	226
1. Evolution of the Velocity Distribution.	226
2. Markovian Form of the Evolution Equation for the Velocity Distribution	231
3. Evolution of Correlations	234
4. Hydrodynamic Situations.	238
6. Bogoliubov's Theory	241
6. Stationary Non-Equilibrium States — Kinetic Equations and Time Scales	241
12. General H-Theorem	244
1. Introduction.	244
2. Approach to Equilibrium of the Velocity Distribution Function	244
3. Approach to Equilibrium of the Correlations	246
4. Articulation Points and Principle of Detailed Balance	250
5. Two-Particle Correlation Function	253
6. Mechanism of Irreversibility	255
13. Quantum Mechanics	257
1. Quantum Mechanical Density Matrix	257
2. Quantum Mechanical Liouville Equation in Interaction Representation	258

3. Wave Vector Conservation	261
4. Pauli Equation	262
14. Irreversibility and Invariants of Motion	265
1. The condition of Dissipativity	265
2. Dissipativity and Poincaré's Theorem	269
3. Analytic Invariants with singular Fourier Transforms	274
4. Approach to Equilibrium and Invariants.	277
Appendix I: Laguerre Functions and Bessel Functions	279
Appendix II: Derivation of the Master Equation by Time-Independent Perturbation Theory.	291
Appendix III: General Theory of Anharmonic Oscillators	297
Appendix IV: Scattering by Randomly Distributed Centers and Van Hove's Diagonal Singularity Conditions	302
Bibliography	308
List of Symbols.	313
Index	317
