Preface	v
Nomenclature	xiii
1 Basic Concepts and Technologies	1
1.1 New Flow Regimes in MEMS	1
1.2 The Continuum Hypothesis	7
1.2.1 Molecular Magnitudes	11
1.2.2 Mixed Flow Regimes	16
1.2.3 Experimental Evidence	17
1.3 The Pioneers	21
1.4 Full-System Simulation of MEMS	24
1.5 Modeling of Micro Flows	31
2 Governing Equations and Slip Models	39
2.1 The Basic Equations of Fluid Dynamics	39
2.1.1 Incompressible Flow	42
2.1.2 Reduced Models	44
2.2 Compressible Flow	45
2.2.1 First-Order Models	47
2.2.2 The Role of the Accommodation Coefficients	49
2.3 High-Order Models	53
2.3.1 Derivation of High-Order Slip Models	54
2.3.2 General Slip Condition	57

2.3.3 Comparison of Slip Models	61
3 Shear-Driven and Separated Micro Flows	63
3.1 Couette Flow	63
3.2 Cavity Flow	67
3.3 Grooved Channel Flow	68
3.4 Separated Internal Flows	71
3.4.1 Validation of Slip Models with DSMC	77
3.5 Separated External Flows	83
4 Pressure-Driven Micro Flows:	
Slip Flow Regime	87
4.1 Isothermal Compressible Flows	87
4.2 Adiabatic Compressible Flows – Fanno Theory	95
4.3 Inlet Flows	101
4.4 Validation of Slip Models with DSMC	102
4.5 Effects of Roughness	108
5 Pressue-Driven Micro Flows: Transition and Free-Molecular Regimes	113
5.1 Transition and Free-Molecular Flow Regimes	113
5.2 Burnett Equations in Micro Channels	117
5.3 A Unified Flow Model	119
5.3.1 Velocity Scaling	119
5.3.2 Flowrate Scaling	122
5.3.3 Model for Pipe and Duct Flows	127
6 Thermal Effects in Micro Scales	139
6.1 Thermal Creep (Transpiration)	139
6.1.1 Simulation Results	141
6.1.2 A Thermal Creep Experiment	145
6.1.3 Knudsen Compressors	146
6.1.4 Other Temperature-Induced Flows	147
6.1.5 Heat Conduction and the Ghost Effect	149
6.2 Heat Transfer in Micro Poiseuille Flows	151
6.3 Heat Transfer in Micro Couette Flows	158
7 Prototype Applications of Gas Micro Flows	163
7.1 Gas Damping and Dynamic Response of MEMS	163
7.1.1 Reynolds Equation	166
7.1.2 Squeezed Film Effects in Accelerometers	173
7.2 Micro Propulsion and Micro Nozzle Flows	178
7.2.1 Micro Propulsion Analysis	180

7.2.2 Rarefaction and Other Effects 184

8 Electrokinetically Driven Liquid

Micro Flows **193**

8.1 Electrokinetic Effects – Review 194

8.2 The Electric Double Layer 195

8.3 Near-Wall Potential Distribution 197

8.4 Governing Equations for Electroosmotic Flows 199

8.4.1 Numerical Formulation and Validation 200

8.5 Electrokinetic Micro Channel Flows 202

8.6 EDL/Bulk Flow Interface Velocity Matching Condition 207

8.7 Electroosmotic Slip Condition 208

8.7.1 Approximate Evaluation of Drag Force due to Electroosmotic Effects 209

8.8 Complex Geometry Flows 210

8.8.1 Cross-Flow Junctions 211

8.8.2 Array of Circular and Square Posts 213

8.9 Dielectrophoresis 215

9 Numerical Methods for

Continuum Simulation **223**

9.1 A High-Order Numerical Method: The μ Flow Code 224

9.1.1 Formulation for Incompressible Micro Flows 228

9.1.2 Formulation for Compressible Micro Flows 231

9.1.3 Implementation of Slip Boundary Conditions 236

9.1.4 Validation Problems 237

9.2 A Meshless Numerical Method 239

9.3 The Force Coupling Method for Particulate Micro Flows 246

10 Numerical Methods for

Atomistic Simulation **257**

10.1 Molecular Dynamics (MD) Method 257

10.1.1 MD-Continuum Coupling 263

10.2 Direct Simulation Monte Carlo (DSMC) Method 266

10.2.1 Limitations and Errors in DSMC 269

10.2.2 DSMC-Information Preservation Method 274

10.2.3 DSMC-Continuum Coupling 275

10.3 The Boltzmann Equation 279

10.3.1 General Theory 279

10.3.2 Classical Solutions of Boltzmann Equation 284

10.3.3 Sone’s Asymptotic Theory of Boltzmann Equation 288

10.3.4 Numerical Solutions of Boltzmann Equation 297

10.3.5 Non-Isothermal Flows	301
10.4 Lattice-Boltzmann Method (LBM)	303
10.4.1 Comparison with Navier-Stokes Solutions	306
10.4.2 LBM Simulation of Micro Flows	308
Bibliography	311
Index	335
