

Table of Contents

1. Introduction	1
1.1 Problem classification	1
1.2 Problem formulation and exact definition of the subject . . .	5
1.2.1 Application of the different models	5
1.2.2 Remarks on the term <i>model</i>	10
1.2.3 Objective and structure of this book	19
2. Fundamental principles of conceptual modeling	23
2.1 Preliminary remarks	23
2.1.1 General remarks	23
2.1.2 Definitions and fundamental terms	29
2.2 System properties	34
2.2.1 Mass and mole fractions.	35
2.2.2 Density	38
2.2.3 Viscosity	42
2.2.4 Specific enthalpy, specific internal energy	44
2.2.5 Surface tension	47
2.2.6 Specific heat capacity	47
2.3 Phase state, phase transition, phase change	48
2.3.1 Phase state	48
2.3.2 Phase transition, phase change	49
2.4 Capillarity	50
2.4.1 Microscopic capillarity	50
2.4.2 Macroscopic capillarity	53
2.4.3 Capillarity in fractures	60
2.5 Hysteresis	64

2.6	Definition of different saturations	65
2.7	Relative permeability	72
2.7.1	Permeability	72
2.7.2	Relative permeability at the micro scale	72
2.7.3	Relative permeability at the macro scale	73
2.7.4	Relative permeability-saturation relation in fractures .	80
2.7.5	Fracture-matrix interaction	81
2.8	Pressure and temperature dependence of porosity.....	82
3.	Mathematical modeling	85
3.1	General balance equation	85
3.1.1	Preconditions and assumptions.....	85
3.1.2	The Reynolds transport theorem in integral form	87
3.1.3	Derivation of the general balance equation	88
3.1.4	Initial and boundary conditions	91
3.1.5	Choice of the primary variables	93
3.2	Continuity equation per phase	95
3.2.1	Time derivative	97
3.3	Momentum equation and Darcy's law	97
3.3.1	General remarks	97
3.3.2	Darcy's law of single-phase flow	101
3.3.3	Generalization of Darcy's law for multiphase flow	102
3.4	General form of the multiphase flow equation	103
3.4.1	Pressure formulation	104
3.4.2	Pressure-saturation formulation	105
3.4.3	Saturation formulation	106
3.4.4	Mathematical modeling for three-phase infiltration and remobilization processes	109
3.5	Transport equation	114
3.5.1	Basic transport equation	114
3.5.2	Transport in a multiphase system	116
3.5.3	Description of the mass transfer between phases	117
3.5.4	Multicomponent transport processes in the gas phase .	120
3.6	Energy equation	132
3.7	Multiphase/multicomponent system	136

4. Numerical modeling	141
4.1 Classification	141
4.1.1 Problem and special solution methods	141
4.1.2 Fundamentals of discretization	145
4.1.3 Conservative discretization	147
4.1.4 Weighted residual method	152
4.2 Finite element and finite volume methods	155
4.2.1 Spatial discretization	155
4.2.2 Choice of element types	158
4.2.3. Galerkin finite element method	160
4.2.4 Subdomain collocation — finite volume method	163
4.2.5 Time discretization	164
4.3 Linearization of the multiphase problem	169
4.3.1 Weak nonlinearities	169
4.3.2 Strong nonlinearities	169
4.3.3 Handling of the nonlinearities	169
4.3.4 Example: Linearized two-phase equation	171
4.4 Discussion of the instationary hyperbolic (convective) transport equation	175
4.4.1 Classification of hyperbolic differential equations	175
4.4.2 A linear hyperbolic transport equation	176
4.4.3 A quasilinear hyperbolic transport equation — Buckley-Leverett equation	177
4.4.4 Analytical solutions for the Buckley-Leverett problem	195
4.5 Special discretization methods	196
4.5.1 Motivation	196
4.5.2 Upwind method — finite difference method	200
4.5.3 Explicit upwind method of first order — Fully Upwind	201
4.5.4 Multidimensional upwind method of first order	205
4.5.5 Explicit upwind method of higher order — TVD techniques	208
4.5.6 Implicit upwind method of first order — Fully Upwind	213
4.5.7 Petrov-Galerkin finite element method	214
4.5.8 Additional remarks on conservative discretization	221

4.5.9	Flux-corrected method	222
4.5.10	Mixed-hybrid finite element methods	225
5.	Comparison of the different discretization methods	229
5.1	Discretization	231
5.1.1	Finite element <i>Galerkin</i> method	232
5.1.2	Subdomain collocation finite volume method (box method)	238
5.2	Boundedness principle — discussion of a monotonic solution .	242
5.3	Comparative study of the different methods in homogeneous porous media	250
5.3.1	Multiphase flow without capillary pressure effects — <i>Buckley-Leverett</i> problem	250
5.3.2	Multiphase flow with capillary pressure effects — <i>Mc Whorter</i> problem	258
5.4	Heterogeneity effects	264
5.5	Comparative study of the methods for flow in heterogeneous porous media	275
5.6	Five-spot waterflood problem	290
6.	Test problems — applications	299
6.1	DNAPL-Infiltration	299
6.2	LNAPL-Infiltration	317
6.3	Non-isothermal multiphase/multicomponent flow	324
6.3.1	Heat pipe	324
6.3.2	Study of bench-scale experiments	335
7.	Final remarks	343
