INTRODUCTION	1
CHAPTER 1. TRANSPORT PROPERTIES OF SIMPLE FLUIDS CONFINED IN NARROW CAPILLARY PORES	3
1. Experimental Studies	3
1.1. Diffusion coefficients	4
1.2. Viscosity	9
2. Computer Simulations of the Transport Processes in Fluids Confined in Narrow Capillary Pores	13
2.1. Diffusion	15
2.1.1. Slit pore	18
2.1.2. Cylindrical and sphere-cylindrical pores	28
2.1.3. Simulations of the diffusion coefficients for fluids confined in porous media	39
2.2. The shear viscosity and thermal conductivity	44
2.2.1. Slit pore	46
3. Theory	53
References	57
CHAPTER 2. GENERALIZATION OF THE ZWANZIG-MORI PROJECTION OPERATOR METHOD	62
1. Collective Dynamic Variables	62
1.1. The Liouville equation for collective dynamic variables	62
1.2. Expansions of collective dynamic variables	63
1.3. Simplification of expansions of collective dynamic variables	68
2. Projection Operator Technique	69
2.1. Definition of the generalized Zwanzig-Mori projection operator	69
2.2. Systems of matrix equations for projections of collective dynamic variables	71
2.3. Summary of the projection scheme	74
2.4. The generalized Langevin equation (GLE)	75
References	77
CHAPTER 3. KINETIC THEORY OF DENSE, STRONGLY INHOMOGENEOUS FLUIDS	79
1. The Master Equations for Mixtures of Dense, Strongly Inhomogeneous Fluids	79

1.1. Statistical mechanical description of mixtures of inhomogeneous fluids	79
1.2. The GLEs for the singlet distribution functions of inhomogeneous fluid mixtures	82
2. Calculation of the Frequency Matrix $i\Omega(x, x')$	85
2.1. The static correlation matrix and the Ornstein-Zernike equation	85
2.2. Calculation of $i\Omega^o(x, x')$	87
2.3. Calculation of $i\Omega^l(x, x')$	89
2.4. Calculation of $i\Omega^E(x, x')$	93
2.5. Explicit expressions for the interactional part of the frequency matrix $i\Omega(x, x')$	96
3. The Explicit Form of the Mean-Field Kinetic Equations for Inhomogeneous Fluid Mixtures	97
4. Summary of the Kinetic Theory	99
References	100
CHAPTER 4. TRANSPORT THEORY OF DENSE, STRONGLY INHOMOGENEOUS FLUIDS	102
1. The Thirteen-Moments Approximation Equations	102
1.1. The generalized Hermite polynomials and continuum variables	104
1.2. The thirteen-moments approximation equations	106
2. The linearized Navier-Stokes Equations	115
2.1. Analysis of the differential equations of the thirteen-moments approximation	115
2.2. The linearized Navier-Stokes equations for dense, strongly inhomogeneous fluids	120
3. Transport Coefficients of Inhomogeneous Fluids	131
References	134
CHAPTER 5. TRANSPORT COEFFICIENTS OF INHOMOGENEOUS FLUIDS CONFINED IN NARROW CAPILLARY PORES	136
1. Simplification of the Quasihydrodynamic Equations and Expressions for the Transport Coefficients	136
2. Transport Coefficients in Immediate Vicinity of Structured Solid Walls	139
3. Dense Homogeneous Fluids	140
4. Transport Coefficients of Fluids Inhomogeneous in Only One Direction	143
5. Correlations between Transport Coefficients and Local Values of the Number Density	148
6. Recommendations for Applications of the Above Transport Theory	152
References	154

## CONTENTS

xi

APPENDIX. GENERALIZED COMPRESSIBILITY EQUATION FOR INHOMOGENEOUS FLUIDS	156
1. One Remarkable Corollary of the Mechanical Equilibrium Condition	156
2. The Explicit Expression for $\phi [n; r_1, r_2]$	158
3. The Generalized Compressibility Equation	160
4. Pressure as the Local Grand Canonical Potential Density	160
References	162
SUBJECT INDEX	165
