

Antony Speyer

Contents

Introduction	<i>page</i> 1
I Basic Characteristics	3
1.1 Perfect conductivity and the critical magnetic field	3
1.2 Superconducting elements and compounds	5
1.3 The Meissner effect	6
1.4 The specific heat	9
1.5 Theoretical treatments	11
II Phenomenological Thermodynamic Treatment	13
2.1 The phase transition	13
2.2 Thermodynamics of mechanical effects	16
2.3 Interrelation between magnetic and thermal properties	17
2.4 The Gorter-Casimir two-fluid model	19
III Static Field Description	22
3.1 Perfect diamagnetism	22
3.2 Influence of geometry and the intermediate state	23
3.3 Trapped flux	26
3.4 The perfect conductor	27
3.5 The London equations for a superconductor	28
3.6 Quantized flux	32
IV The Pippard Non-local Theory	33
4.1 The penetration depth, λ	33
4.2 The dependence of λ on temperature and field	35
4.3 The range of coherence	39
4.4 The Pippard non-local relations	40
V The Ginzburg-Landau Phenomenological Theory	46

VI	The Surface Energy	<i>page</i> 53
6.1	The surface energy and the range of coherence	53
6.2	The surface energy and the intermediate state	57
6.3	Phase nucleation and propagation	59
6.4	Supercooling in ideal specimens	63
VII	Low Frequency Magnetic Behaviour of Small Specimens	68
7.1	Increase in the critical field	68
7.2	High field threads and superconducting magnets	70
7.3	Variation of the order parameter and the energy gap with magnetic field	71
VIII	The Isotope Effect	74
8.1	Discovery and theoretical considerations	74
8.2	Precise threshold field measurements	76
IX	Thermal Conductivity	80
9.1	Low temperature thermal conductivity	80
9.2	Electronic conduction	82
9.3	Lattice conduction	86
9.4	Thermal conductivity in the intermediate state	87
X	The Energy Gap	88
10.1	Introduction	88
10.2	The specific heat	89
10.3	Electromagnetic absorption in the far infrared	90
10.4	Microwave absorption	93
10.5	Nuclear spin relaxation	96
10.6	The tunnel effect	98
10.7	Far infrared transmission through thin films	102
10.8	The Ferrell-Glover sum rule	106
XI	Microscopic Theory of Superconductivity	109
11.1	Introduction	109
11.2	The electron-phonon interaction	110
11.3	The Cooper pairs	111

11.4	The ground state energy	<i>page</i> 113
11.5	The energy gap at 0°K	119
11.6	The superconductor at finite temperatures	119
11.7	Experimental verification of predicted thermal properties	122
11.8	The specific heat	126
11.9	Coherence properties and ultrasonic attenuation	127
11.10	Electromagnetic properties	130
XII	Superconducting Alloys and Compounds	132
12.1	Introduction	132
12.2	Dilute solid solutions with non-magnetic impurities	132
12.3	Compounds with magnetic impurities	136
12.4	Superimposed metals	139
XIII	Superconducting Devices	142
13.1	Research devices	142
13.2	Superconducting magnets	143
13.3	Superconducting computer elements	146
	Bibliography	153
	Index	166
