Preface	vii
Acknowledgements	viii
Author biography	ix
1 Introduction	1-1
1.1 States of matter	1-1
1.2 Characteristics of the gas phase	1-2
1.3 Gases and vapours	1-3
1.4 Phase diagrams and phase transitions: under what conditions is a substance a gas?	1-3
1.4.1 Constructing a phase diagram: the Clapeyron and Clausius–Clapeyron equations	1-4
2 Pressure and temperature	2-1
2.1 Pressure	2-1
2.1.1 Measurement of pressure	2-2
2.2 Temperature	2-5
2.2.1 Thermal equilibrium and measurement of temperature	2-6
3 Relationships between gas properties: the gas laws	3-1
3.1 The relationship between pressure and volume	3-1
3.2 The effect of temperature on pressure and volume	3-2
3.3 The effect of the amount of gas, n	3-3
3.4 equation of state for an ideal gas	3-3
4 Ideal gases and real gases	4-1
4.1 The ideal gas model	4-1
4.2 The compression factor, Z	4-2
4.3 equations of state for real (non-ideal) gases	4-4
5 A molecular perspective: the kinetic theory of gases and the molecular speed distribution	5-1
5.1 Collisions with the container walls—determining pressure from molecular speeds	5-1
5.2 The Maxwell–Boltzmann distribution revisited	5-4

5.3	Mean speed, most probable speed and root-mean-square speed of the particles in a gas	5-6
6	Collision rates in gases	6-1
6.1	Collisions with the container walls	6-1
6.2	Collisions with other molecules	6-2
6.3	Mean free path	6-4
6.4	Effusion and gas leaks	6-4
6.5	Molecular beams	6-5
	6.5.1 Effusive sources	6-6
	6.5.2 Supersonic sources	6-7
7	Transport properties of gases	7-1
7.1	Flux	7-1
7.2	Diffusion	7-2
7.3	Thermal conductivity	7-3
7.4	Summary	7-5
	Appendix: the equipartition theorem	A-1
